BUSINESS

Q1. A company deploys a Microsoft Copilot Studio agent that integrates with a Microsoft Power Automate desktop flow.

You need to recommend a testing solution that meets the following requirements:

- Test cases must validate the most recent changes to the agent before the agent is released.
- The flow must be validated as part of the agent's orchestration.

What should you recommend for each requirement?

Validate the most recent changes to the agent before release:

▼

Publish the agent to a channel and test the agent on live users.

Run tests against the latest unpublished version of the agent.

Run tests against the production version of the agent.

Validate the flow as part of the agent's orchestration:

▼

Add the flow to the agent as a tool.

Add the flow to a canvas app.

Use the Power Automate for desktop console.

Answer:

Validate the most recent changes to the agent before release:

▼

Publish the agent to a channel and test the agent on live users.

Run tests against the latest unpublished version of the agent.

Run tests against the production version of the agent.

Validate the flow as part of the agent's orchestration:

▼

Add the flow to the agent as a tool.

Add the flow to a canvas app.

Use the Power Automate for desktop console.

Explanation:

Correct Answers:

Run tests against the latest unpublished version of the agent.

This option is correct because unpublished versions contain the latest updates and configuration changes made to the agent. Microsoft recommends validating these unpublished changes before deployment so that issues can be identified early without affecting production users. Testing against the unpublished version provides a safe environment to verify orchestration logic, prompts, integrations, and flow execution before publishing the agent to live channels.

Add the flow to the agent as a tool.

This option is correct because Power Automate flows must be configured as tools for the agent to invoke them during conversations and orchestration workflows. Once added as a tool, the agent can dynamically

trigger the flow to perform backend actions, automate processes, or retrieve information. Without adding the flow as a tool, the agent cannot use the flow as part of its orchestration capabilities.

Incorrect Answers:

Publish the agent to a channel and test the agent on live users.

This is incorrect because validation should occur before exposing changes to production users.

Run tests against the production version of the agent.

This is incorrect because the production version does not include the latest unpublished modifications.

Add the flow to a canvas app.

This is incorrect because canvas apps integrate flows into app interfaces, not into agent orchestration.

Use the Power Automate for desktop console.

This is incorrect because the desktop console is intended for desktop flow management and not for agent validation.

Q2. A company plans to deploy a Microsoft Copilot Studio agent to enhance customer support. The company stores customer data across ServiceNow, Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, and Excel files in SharePoint Online. You need to recommend a solution to ensure that the agent can deliver accurate and timely responses. What should you recommend?

- A. Implement a model router for query handling.
- B. Create custom prompts.
- C. Implement Microsoft Power Platform connectors.
- D. Enable incremental indexing in Azure AI Search.

Answer:

C. Implement Microsoft Power Platform connectors.

Explanation:

Correct Answers:

C. Implement Microsoft Power Platform connectors.

This option is correct because the customer data is distributed across multiple enterprise systems such as ServiceNow, Dynamics 365 Finance, Dynamics 365 Supply Chain Management, and SharePoint Online. Microsoft Power Platform connectors enable Microsoft Copilot Studio agents to securely connect to these different data sources and retrieve real-time business information. By using connectors, the agent can access updated records, customer details, tickets, inventory information, and documents from multiple platforms without requiring manual data consolidation. This ensures that the agent provides accurate, context-aware, and timely responses to customer queries.

Incorrect Answers:

A. Implement a model router for query handling.

This is incorrect because model routing controls which AI model handles requests, but it does not provide connectivity to enterprise data sources.

B. Create custom prompts.

This is incorrect because prompts help guide AI behavior, but they do not establish access to external systems or business data.

D. Enable incremental indexing in Azure AI Search.

This is incorrect because Azure AI Search indexing is related to search optimization and indexing updates, not direct integration across multiple enterprise applications.

Q3. A company has Microsoft Power Platform development, staging, and production environments. Each environment has its own Microsoft Dataverse tables and Azure AI Search index.

You are designing an application lifecycle management (ALM) process to deploy a Microsoft Copilot Studio agent between the environments.

The company has a Copilot Studio agent named Agent1 in development. Agent1 uses the following grounding data sources:

- A Dataverse table named CustomerOrders
- An Azure AI Search index named customer-knowledge

You need to deploy Agent1 to production. The solution must ensure that the agent uses the production grounding data sources, minimizes downtime, and handles credentials and endpoints securely.

What should you include in the deployment package solution, and what should you reconfigure after the deployment?

Include in the deployment package solution:

- Agent1 only
- The data sources only
- Agent1 and the data source connections
- Agent1 and references to the data sources
- Agent1, the data sources, and the data source connections

Reconfigure after the deployment:

- The Dataverse connection only
- The Azure AI Search connection only
- The Dataverse and Azure AI Search connections
- The Agent1 configuration
- The environment variables

Answer:

Include in the deployment package solution:

- Agent1 only
- The data sources only
- Agent1 and the data source connections
- Agent1 and references to the data sources**
- Agent1, the data sources, and the data source connections

Reconfigure after the deployment:

- The Dataverse connection only
- The Azure AI Search connection only
- The Dataverse and Azure AI Search connections
- The Agent1 configuration
- The environment variables**

Explanation:**Correct Answers:****Agent1 and references to the data sources**

This option is correct because Microsoft Power Platform ALM best practices recommend packaging the Copilot Studio agent together with references to the grounding data sources instead of embedding environment-specific configurations directly into the solution. By using references, the same solution can be deployed across development, staging, and production environments while allowing each environment to connect to its own Dataverse tables and Azure AI Search indexes. This approach improves portability, minimizes downtime during deployments, and supports standardized CI/CD processes.

The environment variables

This option is correct because environment variables are the preferred mechanism for storing and updating environment-specific settings such as Azure AI Search endpoints, index names, Dataverse configuration values, and service URLs. During deployment to production, the environment variables can be updated to point Agent1 to the production Dataverse tables and the production Azure AI Search index without modifying the solution itself. This aligns with Microsoft ALM and deployment automation best practices for secure and reusable deployments.

Incorrect Answers:**Agent1 only**

This is incorrect because references to the grounding data sources must also be included.

The data sources only

This is incorrect because the Copilot Studio agent itself must be deployed.

Agent1 and the data source connections

This is incorrect because environment-specific connections should not be tightly coupled to the deployment package.

Agent1, the data sources, and the data source connections

This is incorrect because embedding actual connections reduces portability and flexibility across environments.

The Dataverse connection only

This is incorrect because environment-specific settings extend beyond only the Dataverse connection.

The Azure AI Search connection only

This is incorrect because both Dataverse and Azure AI Search settings must be configurable.

The Dataverse and Azure AI Search connections

This is incorrect because Microsoft ALM best practices prefer reconfiguring environment variables rather than manually modifying connections after deployment.

The Agent1 configuration

This is incorrect because the primary post-deployment change involves environment-specific configuration values.

Q4. You are creating validation criteria for a custom generative AI model that produces business reports based on internal enterprise data. You need to assess whether the model's outputs are appropriate and meaningful for the business reports. Which metric should you use?

- A. the number of active users interacting with the model
- B. alignment of the output to domain-specific tasks
- C. the average system resource usage during inference
- D. the model training duration

Answer:

B. alignment of the output to domain-specific tasks

Explanation:

Correct Answers:

B. alignment of the output to domain-specific tasks

This option is correct because the primary requirement is to determine whether the generative AI model produces business reports that are appropriate, meaningful, and relevant to the organization's needs. Evaluating alignment to domain-specific tasks measures how well the model understands business context, follows reporting requirements, generates accurate insights, and produces outputs that are useful for enterprise decision-making. In generative AI validation, task alignment is a key quality metric because it directly evaluates whether the AI system fulfills the intended business purpose.

Incorrect Answers:

A. the number of active users interacting with the model

This is incorrect because user activity measures adoption and usage, not output quality or business relevance.

C. the average system resource usage during inference

This is incorrect because resource usage measures performance efficiency, not whether the generated reports are meaningful.

D. the model training duration

This is incorrect because training duration does not indicate the quality or appropriateness of the generated outputs.

Q5. A company has an Azure environment that supports multiple business units.

The company plans to implement an AI solution that will perform sentiment analysis on customer product reviews. You need to evaluate the potential cost of the solution to support return on AI investment (ROAI) analysis.

What should you use?

- A. Cost Management + Billing
- B. Microsoft Fabric SKU Estimator
- C. Total Cost of Ownership (TCO) Calculator
- D. Azure Reservations

Answer:

C. Total Cost of Ownership (TCO) Calculator

Explanation:

Correct Answers:

C. Total Cost of Ownership (TCO) Calculator

This option is correct because the Azure TCO Calculator is specifically designed to estimate and compare the cost of running workloads in Azure. In this scenario, the company wants to evaluate the potential cost of implementing an AI solution to support Return on AI Investment (ROAI) analysis. The TCO Calculator helps estimate infrastructure and operational costs associated with Azure services and is commonly used during planning and financial assessment phases before deployment. It provides cost projections that help organizations assess business value and investment feasibility.

Incorrect Answers:

A. Cost Management + Billing

This is incorrect because Cost Management + Billing is primarily used for monitoring, tracking, and optimizing existing Azure spending after resources are deployed.

B. Microsoft Fabric SKU Estimator

This is incorrect because the Fabric SKU Estimator is intended for Microsoft Fabric capacity planning, not Azure AI solution cost estimation.

D. Azure Reservations

This is incorrect because Azure Reservations are used to reduce costs through long-term committed usage discounts, not for initial ROAI cost evaluation.

Q6. You need to design a multi-agent solution that will include a custom agent. The solution must meet the following requirements:

- Define the rules and constraints that the agent must follow.
- Automate a backend process that involves data movement between services and runs independently of the agent's reasoning steps.

What should you include in the design for each requirement?

Define rules and constraints:

Agent flows
Conversation topics
Microsoft Power Automate cloud flow

Automate a backend process:

Conversation topics
Microsoft Power Automate cloud flow
Microsoft Power Pages

Answer:

Define rules and constraints:

Agent flows
Conversation topics
Microsoft Power Automate cloud flow

Automate a backend process:

Conversation topics
Microsoft Power Automate cloud flow
Microsoft Power Pages

Explanation:

Correct Answers:

Conversation topics

This option is correct because conversation topics are used to define how the custom agent behaves during interactions, including rules, constraints, response logic, branching conditions, and conversation guidance. In Microsoft Copilot Studio, topics help control the agent's conversational boundaries and ensure that the agent follows predefined business logic and governance requirements. They are commonly used to guide how the agent responds to user inputs and handles specific scenarios.

Microsoft Power Automate cloud flow

This option is correct because Power Automate cloud flows are designed to automate backend business processes, orchestrate integrations, move data between systems, and execute workflows independently of the agent's reasoning process. Cloud flows are ideal for scenarios involving data movement, API integration, notifications, approvals, and automation across multiple services. They operate separately from the conversational logic of the agent.

Incorrect Answers:**Agent flows**

This is incorrect because agent flows are associated with orchestration and execution logic, not specifically for defining conversational rules and constraints.

Conversation topics for backend automation

This is incorrect because topics manage conversational interactions rather than backend workflow automation.

Microsoft Power Pages

This is incorrect because Power Pages is used for creating external-facing websites and portals, not backend process automation.

Q7. A company uses Microsoft Dynamics 365 Finance to manage accounts payable. You are designing an AI invoice processing solution.

You need to recommend the prerequisites to configure a prebuilt copilot for accounts payable. What should you recommend?

- A. From Microsoft Copilot Studio, create an accounts payable agent.
- B. Extend Microsoft 365 Copilot for Sales to an accounts payable agent.
- C. Build an AI tool in Microsoft Foundry.
- D. From the Power Platform admin center, assign the Finance and Operations AI security role to users.

Answer:

D. From the Power Platform admin center, assign the Finance and Operations AI security role to users.

Explanation:**Correct Answers:**

D. From the Power Platform admin center, assign the Finance and Operations AI security role to users.

This option is correct because prebuilt copilot capabilities for Dynamics 365 Finance and Operations applications require the appropriate AI-related security roles and permissions before users can access and configure the functionality. Assigning the Finance and Operations AI security role ensures that authorized users can use AI-powered features such as accounts payable invoice processing and copilot experiences within Dynamics 365 Finance. Configuring the required permissions is a prerequisite for enabling and using these built-in AI capabilities securely.

Incorrect Answers:

A. From Microsoft Copilot Studio, create an accounts payable agent.

This is incorrect because the question refers to configuring a prebuilt copilot, not creating a custom copilot agent from scratch.

B. Extend Microsoft 365 Copilot for Sales to an accounts payable agent.

This is incorrect because Copilot for Sales is intended for sales workflows and is unrelated to Dynamics 365 Finance accounts payable processing.

C. Build an AI tool in Microsoft Foundry.

This is incorrect because Microsoft Foundry is not required to enable or configure the prebuilt accounts payable copilot functionality.

Q8. You need to design a Microsoft Copilot Studio agent that meets the following requirements:

- Supports interactive speech responses
- Optimizes decision-making and the accuracy of responses

What should you include in the design for each requirement? Each option may be used once, more than once, or not at all.

Supports interactive speech responses:

Optimizes decision-making and response accuracy:

Answer:

Supports interactive speech responses:

Optimizes decision-making and response accuracy:

Explanation:**Correct Answers:****Copilot Studio voice features**

This option is correct because Copilot Studio voice features provide the integrated voice capability required for interactive speech experiences within a Copilot Studio agent. These features enable speech-to-text and text-to-speech interactions, allowing users to communicate naturally with the agent through voice channels.

In a Copilot Studio design scenario, Microsoft expects architects to use the platform's built-in voice capabilities rather than directly integrating lower-level speech infrastructure services.

A deep reasoning model

This option is correct because deep reasoning models are optimized for complex decision-making, contextual understanding, multi-step reasoning, and improved response accuracy. These models can analyze user intent more effectively, validate reasoning paths, and generate higher-quality responses. In enterprise AI solutions, deep reasoning models are commonly used when the goal is to improve the reliability and intelligence of agent responses.

Incorrect Answers:**Azure Language in Foundry Tools**

This is incorrect because it mainly provides language AI capabilities and does not directly optimize advanced reasoning or interactive voice functionality.

Azure AI Speech

This is incorrect because Azure AI Speech is the underlying infrastructure service, while the question focuses on the Copilot Studio design feature to include.

Speech Synthesis Markup Language (SSML)

This is incorrect because SSML is used to customize speech output formatting and pronunciation, not to provide interactive speech capabilities.

Q9. A company uses multiple Microsoft Copilot Studio agents across different channels. You need to recommend a monitoring solution that provides comprehensive telemetry data and performance insights for the agents. What should you include in the recommendation?

- A. Application Insights
- B. Azure Advisor
- C. Azure DevOps
- D. Microsoft Dynamics 365 Customer Voice

Answer:**A. Application Insights****Explanation:****Correct Answers:****A. Application Insights**

This option is correct because Application Insights provides comprehensive telemetry, monitoring, diagnostics, and performance analytics for applications and AI solutions, including Microsoft Copilot Studio agents. It enables organizations to track request performance, response times, failures, usage patterns, dependencies, and user interactions across different channels. Application Insights also helps monitor agent health, troubleshoot issues, and analyze operational behavior using centralized telemetry and analytics dashboards. This makes it the most suitable solution for monitoring Copilot Studio agents at scale.

Incorrect Answers:**B. Azure Advisor**

This is incorrect because Azure Advisor provides best-practice recommendations for Azure resources but does not deliver detailed telemetry or conversational performance insights for Copilot Studio agents.

C. Azure DevOps

This is incorrect because Azure DevOps is used for software development lifecycle management, CI/CD, and project tracking rather than runtime telemetry monitoring.

D. Microsoft Dynamics 365 Customer Voice

This is incorrect because Customer Voice is used for surveys and feedback collection, not operational telemetry or agent performance monitoring.

Q10. A company uses a Microsoft Copilot Studio agent to automate tasks in a web app. During testing, you discover that the automation sometimes fails because of frequent changes to the app's user interface. You need to recommend a solution to ensure that the agent successfully automates the tasks. The solution must minimize changes to the agent. What should you include in the recommendation?

- A. Computer Use in Copilot Studio
- B. custom models in Azure AI Studio
- C. conversation topics in Copilot Studio
- D. an agent flow in Copilot Studio

Answer:**A. Computer Use in Copilot Studio****Explanation:****Correct Answers:****A. Computer Use in Copilot Studio**

This option is correct because Computer Use in Copilot Studio is specifically designed to help agents interact with user interfaces dynamically, even when UI elements or layouts change frequently. It uses AI-driven interaction capabilities to identify and operate applications in a more adaptive manner compared to rigid UI automation approaches. This minimizes the need to constantly modify the agent whenever the web application's interface changes. It is especially useful for resilient automation scenarios involving evolving web apps and desktop interfaces.

Incorrect Answers:**B. custom models in Azure AI Studio**

This is incorrect because custom AI models are used for AI inference and model customization, not UI automation resilience.

C. conversation topics in Copilot Studio

This is incorrect because conversation topics manage conversational logic and interaction flows, not automation of changing application interfaces.

D. an agent flow in Copilot Studio

This is incorrect because agent flows orchestrate processes and workflows but do not specifically address UI instability caused by interface changes.

Q11. You are evaluating a Microsoft Copilot Studio agent that supports Microsoft Dynamics 365 Customer Service representatives.

You need to recommend a testing solution that meets the following requirements:

- Evaluates agent effectiveness during active sessions
- Validates whether the agent delivers accurate and helpful responses
- Provides measurable, actionable insights for continuous improvement

What should you recommend?

- A. Track resolution, deflection, and accuracy by using dashboards and use scripts to ensure consistent responses.
- B. Perform load testing to validate how the agent scales under a high chat volume.
- C. Review historical tickets to find agents that have the shortest resolution times.
- D. Measure uptime and page load times.

Answer:

A. Track resolution, deflection, and accuracy by using dashboards and use scripts to ensure consistent responses.

Explanation:

Correct Answers:

A. Track resolution, deflection, and accuracy by using dashboards and use scripts to ensure consistent responses.

This option is correct because the requirements focus on evaluating the effectiveness and quality of the Copilot Studio agent during real customer interactions. Tracking metrics such as resolution rate, deflection rate, and response accuracy directly measures how successfully the agent assists Customer Service representatives and resolves customer issues. Dashboards provide measurable and actionable insights that help organizations continuously improve the agent's performance. Using scripts and standardized evaluation methods also helps validate consistency and accuracy in the responses generated by the agent.

Incorrect Answers:

B. Perform load testing to validate how the agent scales under a high chat volume.

This is incorrect because load testing evaluates scalability and performance under stress, not response quality or effectiveness.

C. Review historical tickets to find agents that have the shortest resolution times.

This is incorrect because it evaluates human support performance rather than validating the Copilot Studio agent's response quality and effectiveness.

D. Measure uptime and page load times.

This is incorrect because uptime and page load metrics focus on infrastructure availability and performance, not conversational accuracy or helpfulness.

Q12. You are designing end-to-end test scenarios for a business solution that uses Microsoft Dynamics 365 Sales and Dynamics 365 Finance.

You need to ensure that the business solution meets the following test requirements:

- Properly exchanges data between the Dynamics 365 apps
- Aligns with defined user workflows and business processes

Which type of testing should you use for each requirement? Each testing type may be used once, more than once, or not at all.

Drift
Exploratory
Integration
Performance
User acceptance

Properly exchanges data between the Dynamics 365 apps:

Aligns with defined user workflows and business processes:

Answer:

Drift
Exploratory
Integration
Performance
User acceptance

Properly exchanges data between the Dynamics 365 apps:

Integration

Aligns with defined user workflows and business processes:

User acceptance

Explanation:**Correct Answers:****Integration**

This option is correct because integration testing validates that different systems, applications, and services exchange data correctly and work together as expected. In this scenario, the requirement focuses on verifying that data is properly exchanged between Dynamics 365 applications. Integration testing ensures that interfaces, APIs, workflows, and connected systems communicate accurately without data loss or synchronization issues.

User acceptance

This option is correct because user acceptance testing validates that the solution aligns with real business workflows, operational requirements, and user expectations. It confirms that the implemented processes

support the intended business scenarios and that end users can successfully perform their tasks using the system. User acceptance testing is commonly performed before production rollout to ensure business readiness.

Incorrect Answers:**Drift**

This is incorrect because drift testing is related to detecting changes in AI model behavior or data patterns over time.

Exploratory

This is incorrect because exploratory testing is informal testing used to discover unexpected issues rather than validate defined business workflows.

Performance

This is incorrect because performance testing measures responsiveness, scalability, and system efficiency rather than validating workflow alignment or data exchange correctness.

Q13. A company uses Microsoft Foundry agents. You need to ensure that an agent can dynamically use external tools at runtime without updating the agent. What should you include in the solution?

- A. a Microsoft Foundry hub
- B. a Model Context Protocol (MCP) server
- C. Azure AI Search
- D. Microsoft Copilot Studio

Answer:

B. a Model Context Protocol (MCP) server

Explanation:**Correct Answers:**

B. a Model Context Protocol (MCP) server

This option is correct because a Model Context Protocol, or MCP, server enables AI agents to dynamically discover and use external tools, APIs, and resources at runtime without requiring updates to the agent itself. MCP provides a standardized mechanism for connecting agents to external capabilities in a flexible and extensible manner. This allows new tools and integrations to be added independently while the agent dynamically accesses them as needed during execution. It is specifically designed to support tool interoperability and runtime extensibility for AI agents.

Incorrect Answers:

A. a Microsoft Foundry hub

This is incorrect because a Foundry hub is used for organizing and managing AI resources, not for dynamically exposing external tools at runtime.

C. Azure AI Search

This is incorrect because Azure AI Search provides indexing and retrieval capabilities for data search scenarios, not dynamic tool integration.

D. Microsoft Copilot Studio

This is incorrect because Copilot Studio is used for creating and managing conversational agents, but it does not itself provide dynamic runtime tool discovery like MCP.

Q14. A company deploys agents that generate responses by using Azure OpenAI resources. The agents are deployed to both the United States and Europe.

You need to recommend a governance solution that meets the following requirements:

- Enforces the deployment of the resources to only approved Azure regions
- Provides continuous compliance verification of the resources

What should you include in the recommendation for each requirement?

Enforces the deployment of the resources to only approved regions:

Azure Monitor
Azure Policy
Microsoft Defender for Cloud
Microsoft Purview
Microsoft Sentinel

Provides continuous compliance verification of the resources:

Azure Monitor
Azure Policy
Microsoft Defender for Cloud
Microsoft Purview
Microsoft Sentinel

Answer:

Enforces the deployment of the resources to only approved regions:

Azure Monitor
Azure Policy
Microsoft Defender for Cloud
Microsoft Purview
Microsoft Sentinel

Provides continuous compliance verification of the resources:

Azure Monitor
Azure Policy
Microsoft Defender for Cloud
Microsoft Purview
Microsoft Sentinel

Explanation:

Correct Answers:

Azure Policy

This option is correct because Azure Policy is specifically designed to enforce governance and compliance rules across Azure environments. It can restrict resource deployments to approved Azure regions by using policy definitions that deny deployments outside allowed geographic locations. This helps organizations maintain regulatory compliance, data residency requirements, and governance standards across multi-region Azure deployments.

Microsoft Defender for Cloud

This option is correct because Microsoft Defender for Cloud provides continuous security posture assessment, compliance monitoring, and regulatory compliance verification for Azure resources. It continuously evaluates deployed resources against compliance standards and security recommendations, helping organizations identify noncompliant resources and maintain ongoing governance visibility across environments.

Incorrect Answers:

Azure Monitor

This is incorrect because Azure Monitor focuses on telemetry, logging, and operational monitoring rather than governance enforcement or compliance verification.

Microsoft Purview

This is incorrect because Microsoft Purview is primarily used for data governance, data cataloging, and data compliance management.

Microsoft Sentinel

This is incorrect because Microsoft Sentinel is a SIEM and SOAR solution focused on security event monitoring and threat detection.

Q15. You are designing a low-code AI business solution by using Microsoft Copilot Studio. The solution must include an agent that automates tasks by simulating user interactions across third-party apps and websites, such as clicking buttons, entering text, and extracting information from screens. You need to recommend what to include in the agent. What should you recommend?

- A. Model Context Protocol (MCP)
- B. a natural language understanding + (NLU+) model in Copilot Studio
- C. Computer Use in Copilot Studio
- D. Copilot skills

Answer:

C. Computer Use in Copilot Studio

Explanation:

Correct Answers:

C. Computer Use in Copilot Studio

This option is correct because Computer Use in Copilot Studio is specifically designed to automate user interface interactions across applications and websites. It enables agents to simulate human actions such as clicking buttons, entering text, navigating screens, and extracting information from interfaces. This capability is particularly useful when integrating with third-party applications that may not expose APIs. Computer Use allows low-code AI agents to interact dynamically with graphical interfaces and automate tasks in a human-like manner.

Incorrect Answers:

A. Model Context Protocol (MCP)

This is incorrect because MCP enables dynamic access to external tools and services, not UI-based interaction automation.

B. a natural language understanding + (NLU+) model in Copilot Studio

This is incorrect because NLU+ models are used for intent recognition and language understanding rather than interface automation.

D. Copilot skills

This is incorrect because Copilot skills extend functionality and task capabilities but do not specifically provide simulated UI interaction across apps and websites.

Q16. A company has a Microsoft Power Platform solution that contains the following components:

- Microsoft Dataverse tables
- A Microsoft Power BI workspace named WS1
- A canvas app named App1 that uses Dataverse
- A Power BI semantic model that connects to Dataverse by using DirectQuery

You plan to use generative AI to provide answers to queries based on a subset of corporate data. You need to ensure that the data is available as a grounding data source for AI systems.

What should you do?

- A. Populate a Dataverse table.
- B. Share WS1.
- C. Endorse the semantic model.
- D. Export the semantic model.

Answer:

C. Endorse the semantic model.

Explanation:

Correct Answers:

C. Endorse the semantic model.

This option is correct because endorsed Power BI semantic models are recognized as trusted and certified data sources that can be used as grounding data for generative AI experiences within Microsoft AI and Power Platform ecosystems. Endorsement improves discoverability, trust, governance, and usability of the semantic model for AI-based querying and reasoning scenarios. Since the requirement is to make a subset of corporate data available as a grounding data source for AI systems, endorsing the semantic model is the appropriate governance and AI-readiness step.

Incorrect Answers:

A. Populate a Dataverse table.

This is incorrect because the data already exists and the requirement is specifically about making it available as a trusted grounding source for AI systems.

B. Share WS1.

This is incorrect because sharing a Power BI workspace grants access permissions but does not establish the semantic model as a trusted grounding data source.

D. Export the semantic model.

This is incorrect because exporting the semantic model does not help AI systems discover or use it as a governed grounding source.

Q17. A company plans to implement an AI solution that will contain a Microsoft Copilot Studio agent and a Microsoft Foundry agent. The solution will be stored in a source code repository.

You need to recommend a deployment method for each agent. The solution must meet the following requirements:

- A test environment must be used before a deployment to production.
- Production must be isolated from development and testing.
- The deployment must be repeatable and fully automated.
- The solution must NOT require manual intervention.
-

Which deployment method should you recommend for each agent?

Copilot Studio:

- Export from the source code repository and import to the target environment.
- Use a Bicep file.
- Use a Microsoft Power Platform deployment pipeline.

Microsoft Foundry:

- Use a Bicep file.
- Use a Microsoft Power Platform deployment pipeline.
- Use an Azure DevOps pipeline.

Answer:

Copilot Studio:

- Export from the source code repository and import to the target environment.
- Use a Bicep file.
- Use a Microsoft Power Platform deployment pipeline.**

Microsoft Foundry:

- Use a Bicep file.
- Use a Microsoft Power Platform deployment pipeline.
- Use an Azure DevOps pipeline.**

Explanation:

Correct Answers:

Use a Microsoft Power Platform deployment pipeline.

This option is correct for Copilot Studio because Microsoft Power Platform deployment pipelines are specifically designed to automate application lifecycle management across development, test, and production environments within the Power Platform ecosystem. Deployment pipelines support environment isolation, repeatable deployments, automated promotion between stages, and reduced manual intervention. They are the recommended deployment approach for Copilot Studio solutions and Power Platform components.

Use an Azure DevOps pipeline.

This option is correct for Microsoft Foundry because Foundry solutions and Azure-based AI resources are commonly deployed using infrastructure-as-code and CI/CD automation through Azure DevOps pipelines. Azure DevOps supports fully automated deployments, testing stages, source control integration, environment separation, and repeatable deployment processes. This aligns with the requirement for automation, production isolation, and deployment consistency.

Incorrect Answers:

Export from the source code repository and import to the target environment.

This is incorrect because it introduces manual intervention and does not provide a fully automated deployment process.

Use a Bicep file.

This is incorrect because Bicep is primarily an infrastructure-as-code deployment template and not a complete deployment orchestration solution for Copilot Studio ALM workflows.

Use a Microsoft Power Platform deployment pipeline for Microsoft Foundry

This is incorrect because Power Platform deployment pipelines are intended for Power Platform solutions rather than Azure AI Foundry deployments.

Note: This section contains one or more sets of questions with the same scenario and problem. Each question presents a unique solution to the problem. You must determine whether the solution meets the stated goals. More than one solution in the set might solve the problem. It is also possible that none of the solutions in the set solve the problem.

In real exam, after you answer a question in this section, you will NOT be able to return. As a result, these questions do not appear on the Review Screen in exam.

Q18. A company uses Microsoft 365 and Dynamics 365.

You need to recommend a solution to automatically summarize email threads, generate suggested replies in Microsoft Outlook, and provide meeting preparation summaries that include relevant customer relationship management (CRM) data.

Solution: You recommend Microsoft 365 Copilot for Sales.

Does this meet the goal?

- A. Yes
- B. No

Answer:

A. Yes

Explanation:

Correct Answer:

A. Yes

This option is correct because Microsoft 365 Copilot for Sales is designed to integrate Microsoft 365 applications such as Outlook and Teams with Dynamics 365 CRM data. It can automatically summarize email threads, generate AI-based suggested replies in Outlook, and provide meeting preparation summaries enriched with customer relationship management information from Dynamics 365. This directly satisfies all the requirements stated in the scenario.

Q19. A company uses Microsoft 365 and Dynamics 365.

You need to recommend a solution to automatically summarize email threads, generate suggested replies in Microsoft Outlook, and provide meeting preparation summaries that include relevant customer relationship management (CRM) data.

Solution: You recommend a classic Microsoft Dataverse workflow.

Does this meet the goal?

- A. Yes
- B. No

Answer:

B. No

Explanation:

Correct Answer:

B. No

Solution does not meet the goal because a classic Microsoft Dataverse workflow is a traditional business process automation mechanism and does not provide generative AI capabilities such as summarizing email threads, generating suggested replies in Outlook, or creating AI-driven meeting preparation summaries with CRM context. These capabilities require Microsoft 365 Copilot for Sales or similar AI-powered Copilot services that integrate Microsoft 365 productivity tools with Dynamics 365 CRM data.

Q20. A company uses Microsoft 365 and Dynamics 365.

You need to recommend a solution to automatically summarize email threads, generate suggested replies in Microsoft Outlook, and provide meeting preparation summaries that include relevant customer relationship management (CRM) data.

Solution: You recommend a Microsoft 365 Copilot agent template.

Does this meet the goal?

- A. Yes
- B. No

Answer:

B. No

Explanation:

Correct Answer:

B. No

Solution does not meet the goal because a Microsoft 365 Copilot agent template alone does not specifically provide the integrated sales productivity capabilities required in the scenario. The requirements include automatic email summarization, suggested Outlook replies, and meeting preparation summaries enriched with Dynamics 365 CRM data. These capabilities are specifically delivered through Microsoft 365 Copilot for Sales, which is designed to integrate Microsoft 365 applications with Dynamics 365 customer relationship management data.

A generic Microsoft 365 Copilot agent template does not inherently provide these specialized CRM-integrated sales assistance features.

Q21. A company has a Microsoft 365 E5 subscription and uses Microsoft Copilot Studio.

The company has a Microsoft SharePoint Online library that contains 10,000 policy PDFs from various departments. The library contains a populated column named Department for each PDF. You need to design a Copilot Studio agent that will use the SharePoint library as a knowledge source.

The solution must meet the following requirements:

- Enable the agent to answer user questions about company policies.
- Ensure that the agent can identify which departments and policies are connected.

What should you include in the design for each requirement?

Enable the agent to answer questions about company policies:

Build a custom model in Microsoft Foundry.
From Copilot Studio, add SharePoint as a knowledge source.
Import the PDFs into Microsoft Dataverse.
Use AI Builder to process and feed SharePoint content.

Identify which departments and policies are connected:

Apply Microsoft Purview sensitivity labels.
Create a Microsoft Dataverse table for the departments.
From Copilot Studio, configure the SharePoint tool.
Upgrade to SharePoint Premium.

Answer:

Enable the agent to answer questions about company policies:

Build a custom model in Microsoft Foundry.
From Copilot Studio, add SharePoint as a knowledge source.
Import the PDFs into Microsoft Dataverse.
Use AI Builder to process and feed SharePoint content.

Identify which departments and policies are connected:

Apply Microsoft Purview sensitivity labels.
Create a Microsoft Dataverse table for the departments.
From Copilot Studio, configure the SharePoint tool.
Upgrade to SharePoint Premium.

Explanation:

Correct Answers:

From Copilot Studio, add SharePoint as a knowledge source.

This option is correct because Copilot Studio supports SharePoint Online libraries as native knowledge sources. By adding the SharePoint library as a knowledge source, the agent can retrieve and use information

from the policy PDFs to answer user questions. This enables retrieval-augmented responses directly from enterprise documents stored in SharePoint without requiring custom AI model development or manual data migration.

From Copilot Studio, configure the SharePoint tool.

This option is correct because configuring the SharePoint tool allows the agent to use SharePoint metadata and document context, including the populated Department column associated with each policy PDF. This helps the agent identify relationships between departments and policies and provide context-aware responses based on SharePoint document metadata.

Incorrect Answers:

Build a custom model in Microsoft Foundry.

This is incorrect because Copilot Studio can directly use SharePoint as a knowledge source without requiring a custom AI model.

Import the PDFs into Microsoft Dataverse.

This is incorrect because the documents already exist in SharePoint Online and do not need to be migrated to Dataverse.

Use AI Builder to process and feed SharePoint content.

This is incorrect because AI Builder is unnecessary when Copilot Studio natively supports SharePoint knowledge integration.

Apply Microsoft Purview sensitivity labels.

This is incorrect because sensitivity labels help classify and protect content but do not identify relationships between departments and policies.

Create a Microsoft Dataverse table for the departments.

This is incorrect because the Department metadata already exists within the SharePoint library.

Upgrade to SharePoint Premium.

This is incorrect because SharePoint Premium is not required for using SharePoint Online as a Copilot Studio knowledge source.

Q22. A financial services company uses Microsoft Dynamics 365 Finance.

Currently, the company's support staff manually reviews customer transaction histories to detect potential fraud cases before escalating the cases.

You need to recommend an automation solution for the review process. The solution must ensure that escalations reach a human analyst for final decision making. What should you recommend?

- A. Deploy an autonomous agent that closes non-fraud cases automatically.
- B. Use Microsoft 365 Copilot in Word to automatically finalize fraud detection policies.
- C. Configure a task agent to generate fraud risk scores for the human analyst to review.
- D. Export the data to a data lake for analysis in Microsoft Power BI.

Answer:

C. Configure a task agent to generate fraud risk scores for the human analyst to review.

Explanation:**Correct Answers:****C. Configure a task agent to generate fraud risk scores for the human analyst to review.**

This option is correct because the requirement is to automate the fraud review process while ensuring that a human analyst makes the final decision. A task agent can analyze transaction histories, identify suspicious patterns, and generate fraud risk scores automatically. The results can then be escalated to a human analyst for review and approval. This approach supports human-in-the-loop decision making, which is especially important in financial services scenarios involving compliance, risk management, and sensitive customer transactions.

Incorrect Answers:**A. Deploy an autonomous agent that closes non-fraud cases automatically.**

This is incorrect because the requirement specifically states that escalations must reach a human analyst for final decision making.

B. Use Microsoft 365 Copilot in Word to automatically finalize fraud detection policies.

This is incorrect because Copilot in Word is unrelated to transaction fraud review automation.

D. Export the data to a data lake for analysis in Microsoft Power BI.

This is incorrect because Power BI supports reporting and analytics but does not automate fraud review and escalation workflows.

Q23. A company has a Microsoft Copilot Studio agent that provides answers based on a knowledge base for customer support.

Users report that, occasionally, the agent provides inaccurate answers.

You need to use metrics from the Analytics tab in Copilot Studio to identify the cause of the inaccuracies.

Which two options should you use?

- A. survey results
- B. session information and session outcomes
- C. topic usage and topics with low resolution
- D. engagement, resolution, and escalation rates
- E. quality of generated answers

Answer:**C. topic usage and topics with low resolution****E. quality of generated answers****Explanation:****Correct Answers:****C. topic usage and topics with low resolution**

This option is correct because topic usage analytics help identify which topics are most frequently triggered and which topics fail to resolve customer queries successfully. Topics with low resolution rates indicate that users are not receiving satisfactory answers or that the conversation flow is not properly addressing their

requests. Analyzing low-resolution topics helps identify where inaccuracies or gaps in the agent's logic and response handling are occurring.

E. quality of generated answers

This option is correct because the quality of generated answers metric directly evaluates the relevance, grounding quality, and usefulness of AI-generated responses from the knowledge base. Since the agent generates answers using enterprise knowledge sources, this metric is critical for identifying whether inaccurate responses are caused by poor grounding, outdated knowledge content, or issues in generative answer quality. It provides targeted insights into the effectiveness of generated AI responses.

Incorrect Answers:

A. survey results

This is incorrect because survey results provide user satisfaction feedback but do not directly identify the root cause of inaccurate answers.

B. session information and session outcomes

This is incorrect because session metrics provide high-level operational insights rather than directly diagnosing answer accuracy issues.

D. engagement, resolution, and escalation rates

This is incorrect because these metrics measure overall operational performance and user interaction trends rather than the quality of generated answers.

Q24. A company uses Microsoft Dynamics 365 Finance for accounts payable and customer debt recovery. You are designing an AI finance process that meets the following requirements:

- Provides AI-driven details to help staff identify overdue vendor invoices and outstanding balances
- Helps staff reduce how long it takes to review overdue invoices and payment history

You need to recommend which Microsoft Copilot features to include in the design.

What should you recommend for each requirement?

Help identify vendor overdue invoices and outstanding balances:

- Agent management
- AI Summaries with Copilot
- The Account Reconciliation agent
- The Supplier Communication agent

Reduce how long it takes to review overdue invoices and payment history:

- Analyze demand plans with Copilot
- Collections coordinator summary
- The Account Reconciliation agent
- The Supplier Communication agent

Answer:

Help identify vendor overdue invoices and outstanding balances:

Agent management
AI Summaries with Copilot
The Account Reconciliation agent
The Supplier Communication agent

Reduce how long it takes to review overdue invoices and payment history:

Analyze demand plans with Copilot
Collections coordinator summary
The Account Reconciliation agent
The Supplier Communication agent

Explanation:

Correct Answers:

The Account Reconciliation agent

This option is correct because the Account Reconciliation agent is specifically designed to support reconciliation and financial matching processes in Dynamics 365 Finance. It helps identify overdue vendor invoices, outstanding balances, discrepancies, and unpaid financial items across accounts payable operations. The agent provides AI-driven visibility into reconciliation issues and helps staff quickly identify accounts that require attention, making it the most appropriate solution for overdue invoice and balance identification.

Collections coordinator summary

This option is correct because the Collections coordinator summary uses AI-generated summaries to consolidate overdue invoice details, payment history, customer balances, and collections information into an easily reviewable format. This significantly reduces the manual effort and time required for staff to analyze customer debt recovery information and payment activities. It improves productivity by presenting key insights and overdue account details in a summarized view.

Incorrect Answers:

Agent management

This is incorrect because it is used for managing AI agents rather than finance-specific reconciliation or collections activities.

AI Summaries with Copilot

This is incorrect because it is a general summarization capability and is less targeted than the specialized collections functionality.

The Supplier Communication agent

This is incorrect because it focuses on supplier communication workflows rather than identifying overdue balances and reconciliation issues.

Analyze demand plans with Copilot

This is incorrect because it is related to supply chain forecasting and demand planning rather than finance operations.

Q25. A company uses a fine-tuned Microsoft Foundry model that requires frequent updates as new customer feedback becomes available.

You need to design an application lifecycle management (ALM) process that meets the following requirements:

- Data changes must be tracked and versioned.
- The model must be retrained consistently by using approved training data.

Which two actions should you include in the design?

- A. Associate the storage location to the fine-tuning job.
- B. Create a content filter.
- C. Store the training data in Azure Files.
- D. Upload the training data to Microsoft Foundry data files
- E. Store the training data in Azure Blob Storage that has version control enabled.

Answer:

D. Upload the training data to Microsoft Foundry data files

E. Store the training data in Azure Blob Storage that has version control enabled.

Explanation:

Correct Answers:

D. Upload the training data to Microsoft Foundry data files

This option is correct because Microsoft Foundry data files provide managed and governed data assets for AI training workflows. By uploading approved training datasets into Foundry data files, organizations can standardize which datasets are used during fine-tuning and retraining operations. This helps ensure repeatable and consistent model retraining processes while maintaining governance and traceability within the AI lifecycle management process.

E. Store the training data in Azure Blob Storage that has version control enabled.

This option is correct because Azure Blob Storage with version control enabled supports tracking and versioning of training dataset changes over time. Since the requirement explicitly states that data changes must be tracked and versioned, Blob versioning provides the necessary governance capabilities, including historical dataset tracking, rollback support, auditability, and controlled dataset evolution. This is a best practice for enterprise AI ALM processes.

Incorrect Answers:

A. Associate the storage location to the fine-tuning job.

This is incorrect because associating storage to a fine-tuning job is primarily an operational configuration step rather than a core ALM strategy for governed dataset management.

B. Create a content filter.

This is incorrect because content filters are used for AI safety and moderation during inference, not for dataset lifecycle management or retraining governance.

C. Store the training data in Azure Files.

This is incorrect because Azure Files is intended for shared file access scenarios and does not provide the same AI-focused versioning and ALM capabilities as Blob Storage.

Q26. You are designing two Microsoft Copilot Studio agents named Agent1 and Agent2.

Each agent must meet the following requirements:

- Each agent must use a standard model.
- Each agent must NOT use generative orchestration.
- Agent1 must support simple and short phrases for a given topic.
- Agent2 must integrate with Microsoft Dynamics 365 Contact Center voice channel.

You need to recommend language models for the agents.

What should you recommend for each agent? Each language model may be used once, more than once, or not at all.

Azure Language in Foundry Tools
Azure OpenAI
Conversational language understanding (CLU)
Natural language understanding (NLU)
Natural language understanding + (NLU+)

Agent1:

Agent2:

Answer:

Azure Language in Foundry Tools
Azure OpenAI
Conversational language understanding (CLU)
Natural language understanding (NLU)
Natural language understanding + (NLU+)

Agent1:

Natural language understanding (NLU)

Agent2:

Natural language understanding + (NLU+)

Explanation:

Correct Answers:

Natural language understanding (NLU) for Agent1

This option is correct because Agent1 must support simple and short phrases for a given topic while using a standard model without generative orchestration. Traditional NLU in Copilot Studio is optimized for intent recognition and deterministic topic routing based on predefined trigger phrases. It works well for structured conversational scenarios involving short and predictable user inputs.

Natural language understanding + (NLU+) for Agent2

This option is correct because Agent2 must integrate with the Microsoft Dynamics 365 Contact Center voice channel while still using a standard non-generative model. NLU+ is designed for advanced conversational and voice scenarios such as IVR and contact center integrations. It supports more sophisticated spoken-language understanding, enhanced entity extraction, and improved handling of natural speech while remaining within classic orchestration models rather than generative orchestration.

Incorrect Answers:

Azure Language in Foundry Tools

This is incorrect because it is a broader Azure AI capability and not the intended Copilot Studio language model choice for this scenario.

Azure OpenAI

This is incorrect because Azure OpenAI is associated with generative AI capabilities, while the requirement explicitly states that generative orchestration must not be used.

Conversational language understanding (CLU)

This is incorrect because, although CLU supports conversational AI scenarios, Microsoft Copilot Studio standard orchestration for Dynamics 365 Contact Center voice scenarios is more specifically aligned with NLU+.

Q27. A company has two Microsoft Power Platform environments named Dev1 and Prod1. A Microsoft Copilot Studio agent named Agent1 is built into a solution in the Dev1 environment. You plan to deploy Agent1 to Prod1. You need to make Agent1 available to the users in Prod1. The solution must minimize administrative effort. What should you do?

- A. Share Agent1 with the users in Prod1.
- B. Export the solution as an unmanaged solution and import the solution into Prod1.
- C. Export the solution as a managed solution and import the solution into Prod1.
- D. Create a new Copilot Studio agent in Prod1 by replicating the configuration of Agent1.

Answer:

C. Export the solution as a managed solution and import the solution into Prod1.

Explanation:

Correct Answers:

C. Export the solution as a managed solution and import the solution into Prod1.

This option is correct because managed solutions are the recommended deployment method for moving Microsoft Power Platform and Copilot Studio solutions from development to production environments. Managed solutions provide controlled deployment, protect production customizations, support application lifecycle management best practices, and minimize administrative effort. They are specifically intended for production deployments where users consume the solution rather than modify it.

Incorrect Answers:

A. Share Agent1 with the users in Prod1.

This is incorrect because sharing an agent does not deploy the solution or make it available within a separate Power Platform environment.

B. Export the solution as an unmanaged solution and import the solution into Prod1.

This is incorrect because unmanaged solutions are typically used for development environments and can lead to uncontrolled modifications in production.

D. Create a new Copilot Studio agent in Prod1 by replicating the configuration of Agent1.

This is incorrect because manually recreating the agent increases administrative effort and does not follow proper ALM practices.

Q28. You are designing an AI strategy for Microsoft Dynamics 365 finance and operations apps. You are evaluating the use of Microsoft Copilot Studio to provide in-app help and guidance based on generative AI general knowledge. You need to recommend which knowledge sources to include in the generative help and guidance agent. The solution must minimize the risk of generating inaccurate responses. What should you recommend?

Custom knowledge sources:

- Must be uploaded to the agent
- Must be excluded from the agent
- Are not supported

AI general knowledge:

- Must be enabled for the agent
- Must be disabled for the agent
- Is not supported

Answer:

Custom knowledge sources:

- Must be uploaded to the agent**
- Must be excluded from the agent
- Are not supported

AI general knowledge:

- Must be enabled for the agent
- Must be disabled for the agent**
- Is not supported

Explanation:**Correct Answers:**

Must be uploaded to the agent

This option is correct because using curated and approved custom knowledge sources helps ground the Copilot Studio agent on trusted enterprise content related to Dynamics 365 finance and operations processes. Uploading controlled knowledge sources improves response accuracy and reduces the likelihood of hallucinations or irrelevant answers. Grounding the agent on authoritative business documentation is a best practice for enterprise AI guidance solutions.

Must be disabled for the agent

This option is correct because enabling AI general knowledge allows the agent to answer using broad internet-scale or generalized AI knowledge, which increases the risk of inaccurate, noncompliant, or hallucinated responses. Since the requirement explicitly states that the solution must minimize the risk of generating inaccurate responses, disabling AI general knowledge ensures that answers are generated only from approved enterprise knowledge sources.

Incorrect Answers:

Must be excluded from the agent

This is incorrect because excluding custom knowledge sources would remove the trusted enterprise grounding required for accurate responses.

Are not supported

This is incorrect because custom knowledge sources are fully supported in Copilot Studio.

Must be enabled for the agent

This is incorrect because enabling AI general knowledge increases the likelihood of inaccurate or ungrounded responses.

Is not supported

This is incorrect because AI general knowledge is supported in Copilot Studio.

Q29. A company has Microsoft 365 Copilot agents.

You need to design a security solution for the agents.

- The solution must meet the following requirements:
- Identify and mitigate potential risks that relate to AI use.
- Protect AI apps and the sensitive data processed or generated by the agents.
- Support responsible AI governance by retaining and logging interactions, detecting policy violations, and investigating incidents.

Which two components should you include in the design?

- A. Microsoft Purview
- B. Azure AI Content Safety
- C. role-based access control (RBAC) in Microsoft Foundry
- D. Microsoft Defender

Answer:

- A. Microsoft Purview**
- D. Microsoft Defender**

Explanation:**Correct Answers:****A. Microsoft Purview**

This option is correct because Microsoft Purview provides responsible AI governance, compliance management, auditing, retention, eDiscovery, and policy enforcement capabilities for Microsoft 365 Copilot agents. It supports logging and retaining AI interactions, detecting policy violations, and investigating incidents involving sensitive enterprise data. Purview is a core governance and compliance solution for enterprise AI environments.

D. Microsoft Defender

This option is correct because Microsoft Defender helps identify and mitigate AI-related security risks while protecting AI applications and sensitive data processed or generated by the agents. Microsoft Defender provides threat detection, security monitoring, anomaly detection, and protection capabilities that help secure AI-powered workloads and applications across the Microsoft ecosystem.

Incorrect Answers:**B. Azure AI Content Safety**

This is incorrect because Azure AI Content Safety primarily focuses on harmful content detection and moderation rather than comprehensive AI governance, security monitoring, and enterprise data protection.

C. role-based access control (RBAC) in Microsoft Foundry

This is incorrect because RBAC controls access permissions but does not provide full AI governance, policy violation detection, logging, retention, or security monitoring capabilities.

Q30. A retail company plans to deploy Microsoft Copilot Studio agents to support:

- Microsoft Dynamics 365 Commerce scenarios.
- A Microsoft Power Apps inventory management solution.

You need to recommend a solution to organize product catalog data as a consistent source for multiple AI systems.

What should you recommend?

- A. Let each agent scrape product details from Microsoft SharePoint Online libraries.
- B. Store the product catalog data in a separate custom table for each agent.
- C. Configure prompts to pull product details from the PDFs of external vendors.
- D. Centralize the product catalog data in Microsoft Dataverse and expose the data to both agents.

Answer:

D. Centralize the product catalog data in Microsoft Dataverse and expose the data to both agents.

Explanation:**Correct Answers:****D. Centralize the product catalog data in Microsoft Dataverse and expose the data to both agents.**

This option is correct because Microsoft Dataverse provides a centralized, governed, scalable, and reusable enterprise data platform for Power Platform and Dynamics 365 solutions. By storing the product catalog in

Dataverse, both the Dynamics 365 Commerce agent and the Power Apps inventory management agent can access a single consistent source of truth. This approach improves data consistency, reduces duplication, simplifies governance, and enables multiple AI systems to use the same trusted business data for grounding and operational processes.

Incorrect Answers:

A. Let each agent scrape product details from Microsoft SharePoint Online libraries.

This is incorrect because scraping SharePoint content creates inconsistent and ungoverned data access patterns and is not a reliable enterprise data architecture.

B. Store the product catalog data in a separate custom table for each agent.

This is incorrect because duplicating product data across separate tables increases maintenance overhead and creates data inconsistency risks.

C. Configure prompts to pull product details from the PDFs of external vendors.

This is incorrect because relying on vendor PDFs is inefficient, difficult to govern, and does not provide a centralized structured enterprise data source.

Q31. You need to design an application lifecycle management (ALM) process for a Microsoft Power Platform environment that contains a solution named Solution1. Solution1 must include a custom connector for Copilot in Microsoft Dynamics 365 Customer Service.

Solution1 must meet the following requirements:

- Ensure that the custom connector can be deployed consistently across environments as part of the ALM process.
- Allow the custom connector to be edited only in the development environment.

What should you include in the design?

- A. Add the custom connector to GitHub.
- B. Share the custom connector.
- C. Create the custom connector in the default solution.
- D. Add the custom connector to Solution1.

Answer:

D. Add the custom connector to Solution1.

Explanation:

Correct Answers:

D. Add the custom connector to Solution1.

This option is correct because custom connectors must be included inside a Power Platform solution to participate properly in application lifecycle management processes. By adding the custom connector to Solution1, the connector can be packaged, versioned, exported, and deployed consistently across development, test, and production environments. This also supports managed solution deployments,

ensuring that the connector remains editable only in the development environment while being protected in downstream environments such as staging or production.

Incorrect Answers:**A. Add the custom connector to GitHub.**

This is incorrect because GitHub can support source control, but it does not itself make the connector deployable as part of Power Platform ALM processes.

B. Share the custom connector.

This is incorrect because sharing provides access permissions but does not support controlled deployment or ALM lifecycle management.

C. Create the custom connector in the default solution.

This is incorrect because components created in the default solution are not properly isolated for enterprise ALM and deployment management.

Q32. A company has a Microsoft Copilot Studio agent that uses custom connectors to interact with enterprise APIs. You need to recommend an application lifecycle management (ALM) process to ensure that the connectors are deployed consistently across development, test, and production environments and meet governance and traceability requirements.

What should you recommend?

- A. Deploy the APIs as Azure Functions.
- B. Manage the connectors as solution components and deploy the components by using ALM pipelines.
- C. Maintain connector definitions in environment variables.
- D. Export and import the connectors between the environments as unmanaged solutions

Answer:**B. Manage the connectors as solution components and deploy the components by using ALM pipelines.****Explanation:****Correct Answers:****B. Manage the connectors as solution components and deploy the components by using ALM pipelines.**

This option is correct because Power Platform custom connectors should be managed as solution components to support proper application lifecycle management practices. Including connectors within solutions enables versioning, governance, traceability, repeatable deployments, and controlled promotion across development, test, and production environments. Using ALM pipelines such as Power Platform deployment pipelines or Azure DevOps pipelines ensures consistent and automated deployment processes while maintaining enterprise governance standards.

Incorrect Answers:**A. Deploy the APIs as Azure Functions.**

This is incorrect because deploying APIs as Azure Functions does not address lifecycle management and governance of the Power Platform custom connectors themselves.

C. Maintain connector definitions in environment variables.

This is incorrect because environment variables store configuration values and endpoints, not full connector lifecycle management and deployment definitions.

D. Export and import the connectors between the environments as unmanaged solutions

This is incorrect because unmanaged solutions are not recommended for controlled enterprise ALM processes and reduce governance and traceability capabilities.

Q33. A company has a Microsoft Power Platform environment.

You need to build two agents named Agent1 and Agent2. The solution must meet the following requirements:

- Agent1 must be extendable by using the Semantic Kernel and must connect to multiple business apps and APIs.
- Agent2 must connect directly to data stored in Microsoft Dataverse and must be embeddable in a Microsoft Power Apps canvas app.

What should you use to build each agent?

Agent1:

▼

Microsoft Foundry

Azure Logic Apps

Copilot in Power Apps

Microsoft Copilot Studio

Agent2:

▼

Microsoft Foundry

Azure Logic Apps

Copilot in Power Apps

Microsoft Copilot Studio

Answer:

Agent1:

Microsoft Foundry

Azure Logic Apps

Copilot in Power Apps

Microsoft Copilot Studio

Agent2:

Microsoft Foundry

Azure Logic Apps

Copilot in Power Apps

Microsoft Copilot Studio**Explanation:****Correct Answers:****Microsoft Foundry** for Agent1

This option is correct because Agent1 must be extendable by using Semantic Kernel and connect to multiple business applications and APIs. Microsoft Foundry is designed for pro-code and enterprise AI development scenarios that require advanced orchestration, extensibility, and integration capabilities. It natively supports Semantic Kernel integration, enabling developers to build sophisticated AI agents with custom orchestration, memory, plugins, and API connectivity across enterprise systems.

Microsoft Copilot Studio for Agent2

This option is correct because Agent2 must connect directly to Microsoft Dataverse and be embeddable inside a Power Apps canvas app. Copilot Studio is built natively on the Power Platform and provides seamless Dataverse integration, Power Platform connector support, and native embedding capabilities for Power Apps. It is specifically optimized for low-code conversational AI solutions within the Microsoft business applications ecosystem.

Incorrect Answers:**Azure Logic Apps**

This is incorrect because Logic Apps is primarily an integration and workflow automation platform rather than an AI agent development platform.

Copilot in Power Apps

This is incorrect because Copilot in Power Apps refers to embedded AI assistance features within Power Apps rather than a standalone platform for building deployable AI agents.

Microsoft Foundry for Agent2

This is incorrect because Foundry introduces unnecessary complexity for a low-code Dataverse-connected Power Apps embedding scenario.

Q34. A company has Microsoft Foundry agents that generate responses by using Azure OpenAI resources. The agents are deployed to both the United States and Europe.

A company mandate states that the agents and their grounding data must adhere to data residency and movement regulations.

You need to recommend a governance solution for the agents.

What should you include in the recommendation?

- A. Microsoft Defender for Cloud
- B. Azure Policy
- C. Azure Monitor
- D. Microsoft Purview

Answer:

D. Microsoft Purview

Explanation:

Correct Answers:

D. Microsoft Purview

This option is correct because Microsoft Purview provides enterprise data governance, compliance, and data residency management capabilities. It helps organizations classify, govern, monitor, and control sensitive data across AI systems and enterprise environments. In this scenario, the requirement specifically focuses on ensuring that agents and grounding data comply with data residency and data movement regulations across the United States and Europe. Microsoft Purview supports these governance requirements through data classification, compliance policies, data lineage, auditing, and regulatory compliance management.

Incorrect Answers:

A. Microsoft Defender for Cloud

This is incorrect because Defender for Cloud focuses primarily on security posture management and threat protection rather than data residency governance.

B. Azure Policy

This is incorrect because Azure Policy can enforce deployment restrictions such as allowed regions, but it does not provide comprehensive data governance and data movement compliance management for grounding data.

C. Azure Monitor

This is incorrect because Azure Monitor provides telemetry and operational monitoring rather than governance or compliance management.

Q35. A company has an AI solution built by using Microsoft Copilot Studio and Power Platform. The solution is used by the company's sales, marketing, and customer service teams.

You are performing a return on AI investment (ROAI) analysis to evaluate the impact of the solution. You need to identify which measurable business drivers to include in the analysis.

Which two business drivers should you identify?

- A. the reduced average case resolution time
- B. market capitalization
- C. economic market predictability
- D. increased employee productivity
- E. brand awareness

Answer:

A. the reduced average case resolution time

D. increased employee productivity

Explanation:

Correct Answers:

A. the reduced average case resolution time

This option is correct because reduced case resolution time is a measurable operational improvement directly tied to AI-driven automation and assistance capabilities. Faster issue resolution improves customer service efficiency, reduces operational costs, and increases overall business effectiveness. This is a key measurable business driver commonly used in return on AI investment analyses.

D. increased employee productivity

This option is correct because AI solutions built with Copilot Studio and Power Platform are designed to automate repetitive tasks, accelerate workflows, and improve employee efficiency across departments such as sales, marketing, and customer service. Increased employee productivity is one of the primary measurable business outcomes used to evaluate the value and impact of AI investments.

Incorrect Answers:

B. market capitalization

This is incorrect because market capitalization is influenced by many external financial and economic factors and is not a direct measurable driver for evaluating AI solution impact.

C. economic market predictability

This is incorrect because it is a broad macroeconomic concept rather than a measurable business outcome directly attributable to the AI solution.

E. brand awareness

This is incorrect because brand awareness is difficult to directly quantify as a return on AI investment metric for operational AI business solutions.

Q36. A company has a cloud-based AI solution that uses Azure OpenAI models.

You need to design a monitoring solution that meets the following requirements:

- Monitors performance metrics and operational health for the models
- Monitors AI apps and agents for compliance

- Uses Azure-native capabilities
- Minimizes development effort

What should you use for each requirement? To answer, drag the appropriate options to the correct requirements. Each option may be used once, more than once, or not at all.

Azure API Management

Azure Policy

Microsoft Defender

Azure Monitor

Azure Stream Analytics

Microsoft Purview

Monitors AI app and agents for compliance:

Monitors performance metrics and operational health:

Answer:

Azure API Management

Azure Policy

Microsoft Defender

Azure Monitor

Azure Stream Analytics

Microsoft Purview

Monitors AI app and agents for compliance:

Microsoft Purview

Monitors performance metrics and operational health:

Azure Monitor

Explanation:

Correct Answers:

Microsoft Purview

This option is correct because Microsoft Purview provides governance, compliance monitoring, auditing, data classification, and policy management capabilities for AI applications and agents. It helps organizations monitor AI systems for compliance requirements, track data usage, detect policy violations, and support responsible AI governance across enterprise AI environments.

Azure Monitor

This option is correct because Azure Monitor is the Azure-native service used for monitoring operational health, telemetry, diagnostics, performance metrics, and availability of cloud-based applications and Azure OpenAI workloads. It provides dashboards, alerts, logs, and analytics to monitor AI model performance and operational reliability while minimizing development effort through built-in Azure integrations.

Incorrect Answers:

Azure API Management

This is incorrect because API Management focuses on API publishing, security, and traffic management rather than operational monitoring or AI governance.

Azure Policy

This is incorrect because Azure Policy enforces governance rules and deployment compliance but does not provide operational monitoring or AI compliance analytics.

Microsoft Defender

This is incorrect because Microsoft Defender primarily focuses on security threat detection and protection rather than broader AI compliance governance.

Azure Stream Analytics

This is incorrect because Stream Analytics is designed for real-time event stream processing rather than AI monitoring and governance.

Q37. A company has a canvas app named App1 in a Microsoft Power Platform environment named Env1. Env1 uses a customer-managed key for data encryption. App1 connects to multiple data sources to retrieve and update customer and order information.

You need to recommend a solution to add Microsoft Copilot components to App1. The solution must NOT modify the current security or encryption configurations of Env1.

What should you include in the recommendation?

- A. Modify the data sources of App1 to make them compatible with Copilot.
- B. Duplicate App1 and republish the app in Env1.
- C. Enable Copilot features for Env1.
- D. Move App1 to a new environment that uses Microsoft-managed keys.

Answer:

C. Enable Copilot features for Env1.

Explanation:

Correct Answers:

C. Enable Copilot features for Env1.

This option is correct because Microsoft Copilot features can be enabled within a Power Platform environment that already uses customer-managed keys for encryption. Enabling Copilot capabilities at the environment level allows App1 to use Copilot components without requiring changes to the existing security architecture, encryption configuration, or data protection settings. This satisfies the requirement to preserve the current customer-managed key configuration in Env1.

Incorrect Answers:

A. Modify the data sources of App1 to make them compatible with Copilot.

This is incorrect because Copilot integration does not require modifying existing compatible data sources solely due to customer-managed encryption keys.

B. Duplicate App1 and republish the app in Env1.

This is incorrect because duplicating the app does not address enabling Copilot functionality or provide any security or encryption benefit.

D. Move App1 to a new environment that uses Microsoft-managed keys.

This is incorrect because the requirement explicitly states that the current security and encryption configuration must not be modified.

Q38. A company uses Microsoft Dynamics 365 to manage service operations. Dispatchers coordinate service requests, and technicians perform scheduled on-site work.

You need to design a solution that will use Microsoft Copilot to improve the efficiency of the service operations. The solution must meet the following requirements:

- Provide AI-driven assistance to help staff organize and resolve work orders.
- Deliver contextual AI support to frontline workers as they prepare for and complete customer appointments.

Which two components should you include in the design?

- A. Copilot Service workspace
- B. Copilot in Outlook
- C. Dynamics 365 Customer Service
- D. Copilot in Customer Service
- E. Copilot in Field Service
- F. the Dynamics 365 Field Service mobile app

Answer:

E. Copilot in Field Service

F. the Dynamics 365 Field Service mobile app

Explanation:

Correct Answers:

E. Copilot in Field Service

This option is correct because Copilot in Field Service provides AI-driven assistance for dispatchers and service managers to organize, manage, and resolve work orders more efficiently. It delivers AI-generated summaries, scheduling assistance, service recommendations, and operational insights that help improve service coordination and work order management within Dynamics 365 Field Service.

F. the Dynamics 365 Field Service mobile app

This option is correct because the Dynamics 365 Field Service mobile app provides frontline technicians with contextual support while preparing for and completing customer appointments. When integrated with Copilot capabilities, the mobile app enables technicians to access work order summaries, appointment details, task guidance, voice-driven updates, and operational insights directly from their mobile devices during onsite service activities.

Incorrect Answers:

A. Copilot Service workspace

This is incorrect because it is primarily a workspace interface and not the core operational Field Service AI solution required for dispatchers and technicians.

B. Copilot in Outlook

This is incorrect because Outlook Copilot focuses on email productivity rather than field service operations and onsite technician workflows.

C. Dynamics 365 Customer Service

This is incorrect because Customer Service is focused on contact center and support case management scenarios rather than field dispatch and onsite service operations.

D. Copilot in Customer Service

This is incorrect because the scenario specifically focuses on field service operations, dispatchers, work orders, and technicians rather than customer support agents and case management.

Q39. A company uses Azure OpenAI models that use grounding data from Microsoft Fabric for agents. The models are fine-tuned by using proprietary datasets.

You need to design a governance solution that meets the following requirements:

- Restricts access to the grounding data to only assigned roles
- Restricts model fine-tuning to only the AI engineering team

What should you include in the design?

Restricts access to the grounding data:

Azure AI Content Safety
Azure Monitor alerts
Azure Policy compliance rules
Microsoft Purview access policies

Restricts model fine-tuning:

Azure Policy compliance rules
Azure Resource Manager (ARM) resource locks
Microsoft Entra Conditional Access
Role-based access control (RBAC) in Microsoft Foundry

Answer:

Restricts access to the grounding data:

Azure AI Content Safety
Azure Monitor alerts
Azure Policy compliance rules
Microsoft Purview access policies

Restricts model fine-tuning:

Azure Policy compliance rules
Azure Resource Manager (ARM) resource locks
Microsoft Entra Conditional Access
Role-based access control (RBAC) in Microsoft Foundry

Explanation:

Correct Answers:

Microsoft Purview access policies

This option is correct because Microsoft Purview provides enterprise data governance and access control capabilities for grounding data stored in Microsoft Fabric and other enterprise data platforms. Purview access policies help ensure that only assigned users and roles can access sensitive grounding datasets used by Azure OpenAI agents. This supports secure data governance and controlled access to proprietary enterprise information.

Role-based access control (RBAC) in Microsoft Foundry

This option is correct because RBAC in Microsoft Foundry allows organizations to restrict AI model fine-tuning activities to specific users or groups such as the AI engineering team. RBAC enables granular permission management for AI resources, training workflows, and fine-tuning operations, ensuring that only authorized personnel can modify or retrain models.

Incorrect Answers:

Azure AI Content Safety

This is incorrect because Content Safety focuses on harmful content moderation rather than access control for grounding data.

Azure Monitor alerts

This is incorrect because Azure Monitor provides telemetry and alerting rather than data access governance.

Azure Policy compliance rules

This is incorrect because Azure Policy enforces configuration governance but does not provide detailed role-based data access management for grounding datasets.

Azure Resource Manager (ARM) resource locks

This is incorrect because ARM locks prevent accidental resource deletion or modification but do not control fine-tuning permissions.

Microsoft Entra Conditional Access

This is incorrect because Conditional Access controls authentication conditions and sign-in policies rather than AI fine-tuning authorization management.

Q40. A company has a customer order system that creates sales orders manually.

You need to design an AI solution to automate the following tasks as part of the system:

- Save the order details to a database.
- Update the order status in the database.
- Extract the order details from an order file.
- Prepare and send a confirmation email to customers.

The solution must minimize development effort and support intelligent automation and solution integration. What should you include in the design?

- A. a workflow in Azure Logic Apps
- B. a multi-agent solution that uses the Semantic Kernel SDK
- C. a multi-agent solution that uses Microsoft Foundry Agent Service
- D. a Microsoft Copilot Studio agent that uses Microsoft Power Automate workflows

Answer:

D. a Microsoft Copilot Studio agent that uses Microsoft Power Automate workflows

Explanation:

Correct Answers:

D. a Microsoft Copilot Studio agent that uses Microsoft Power Automate workflows

This option is correct because the requirement focuses on minimizing development effort while supporting intelligent automation and integration across business processes. Microsoft Copilot Studio combined with Power Automate provides a low-code solution for automating workflows such as extracting order details from files, updating databases, managing order statuses, and sending confirmation emails. Power Automate offers built-in connectors and workflow orchestration capabilities, while Copilot Studio adds intelligent AI-driven interactions and automation support. This combination is specifically designed for business process automation scenarios with minimal custom development effort.

Incorrect Answers:

A. a workflow in Azure Logic Apps

This is incorrect because although Logic Apps supports workflow automation and integrations, it does not provide the same low-code AI agent capabilities and business-focused intelligent automation experience as Copilot Studio combined with Power Automate.

B. a multi-agent solution that uses the Semantic Kernel SDK

This is incorrect because Semantic Kernel is a pro-code development framework and would require significantly more custom development effort.

C. a multi-agent solution that uses Microsoft Foundry Agent Service

This is incorrect because Microsoft Foundry Agent Service is intended for advanced enterprise AI agent orchestration scenarios and introduces unnecessary complexity for this business automation requirement.

Q41. A manufacturing company wants to deploy an agent that will automate supplier invoice processing. You are designing a solution to evaluate the financial implications of the deployment. The company is especially concerned about budget overruns.

You need to ensure that the solution considers the total cost of ownership (TCO), the expected savings from using automation, and whether to extend the existing AI capabilities.

What should you include in the design?

- A. a break-even analysis only
- B. adopting prebuilt agents to reduce the deployment time
- C. training a custom model
- D. a return on AI investment (ROAI) analysis

Answer:

D. a return on AI investment (ROAI) analysis

Explanation:

Correct Answer:

D. a return on AI investment (ROAI) analysis

This option is correct because the scenario requires evaluating the complete financial impact of deploying an AI agent.

The requirements explicitly mention:

total cost of ownership (TCO),

expected savings from automation,

and whether extending existing AI capabilities is financially justified.

A Return on AI Investment (ROAI) analysis is specifically designed to assess AI initiatives by considering costs, benefits, risks, savings, productivity gains, and long-term business value.

ROAI provides a comprehensive framework for determining whether the investment will generate sufficient business value while helping identify and mitigate the risk of budget overruns.

Incorrect Answers:

A. a break-even analysis only

This option is incorrect because a break-even analysis focuses only on determining when costs equal benefits. It does not provide a complete assessment of AI value, TCO, strategic benefits, or future AI capability expansion.

B. adopting prebuilt agents to reduce the deployment time

This option is incorrect because using prebuilt agents may reduce implementation effort, but it does not evaluate the overall financial implications of the deployment.

C. training a custom model

This option is incorrect because training a custom model is an implementation decision rather than a financial evaluation methodology. In fact, it may increase costs and does not address the requirement to assess TCO and expected savings.

Q42. A company has an AI solution named Solution1 that is deployed to the production environment. Solution1 uses an Azure OpenAI model to generate marketing emails for existing customers. During an internal review, you identify that Solution1 creates different emails depending on the customers' traits. You need to recommend a strategy to mitigate the bias. The strategy must adhere to Microsoft responsible AI principles.

What should you recommend?

- A. Modify Solution1 to randomly generate emails for different traits.
- B. Modify the system instructions of Solution1.
- C. Retrain the model by using a larger dataset.
- D. Modify the contents of the training dataset.

Answer:

B. Modify the system instructions of Solution1.

Explanation:

Correct Answers:

B. Modify the system instructions of Solution1.

This option is correct because Solution1 uses an Azure OpenAI foundation model provided as a managed service. In Azure OpenAI solutions, one of the primary and recommended approaches for mitigating biased outputs is modifying the system instructions or metaprompts that guide model behavior. By updating the system instructions, the company can enforce fairness constraints, standardize tone and messaging, reduce discriminatory behavior, and align the generated content with Microsoft Responsible AI principles such as fairness, inclusiveness, and reliability. This provides an immediate and governance-aligned mitigation strategy without retraining the underlying model.

Incorrect Answers:

A. Modify Solution1 to randomly generate emails for different traits.

This is incorrect because randomization does not address the root cause of the bias and can introduce inconsistent and unreliable customer experiences.

C. Retrain the model by using a larger dataset.

This is incorrect because Azure OpenAI foundation models are managed pretrained models, and simply increasing dataset size does not guarantee removal of bias.

D. Modify the contents of the training dataset.

This is incorrect because customers typically do not modify the underlying training datasets of Azure OpenAI foundation models. Bias mitigation in Azure OpenAI solutions is usually implemented through prompt engineering, system instructions, and governance controls at the application layer.

Q43. You need to recommend a Microsoft Power Platform solution for customer support. The solution must include AI capabilities in Microsoft Power Automate and must meet the following requirements:

- Use a centralized workspace for AI models.
- Generate short overviews from large amounts of unstructured text, such as case notes or transcripts, without requiring additional training or coding.

What should you include in the recommendation for each requirement?

Use a centralized workspace:

An Microsoft Foundry hub
Azure OpenAI Foundry
Microsoft Copilot Studio
Microsoft Dataverse

Generate short overviews:

An AI Builder prebuilt model
An AI Builder prebuilt prompt
Azure OpenAI
GitHub Copilot
Microsoft Copilot in Power Automate

Answer:

Use a centralized workspace:

A Microsoft Foundry hub

Azure OpenAI Foundry

Microsoft Copilot Studio

Microsoft Dataverse

Generate short overviews:

An AI Builder prebuilt model

An AI Builder prebuilt prompt

Azure OpenAI

GitHub Copilot

Microsoft Copilot in Power Automate

Explanation:

Correct Answers:

A Microsoft Foundry hub

This option is correct because Microsoft Foundry hubs provide a centralized workspace for managing AI resources, models, projects, and governance capabilities across AI solutions. It enables centralized AI model management and supports enterprise AI development and orchestration scenarios within Microsoft ecosystems.

An AI Builder prebuilt prompt

This option is correct because AI Builder prebuilt prompts can generate summaries and short overviews from large amounts of unstructured text such as transcripts, customer conversations, and case notes without requiring additional model training or custom coding. This aligns directly with the requirement for low-code AI summarization capabilities within Microsoft Power Automate.

Incorrect Answers:

Azure OpenAI Foundry

This is incorrect because the centralized AI workspace capability is specifically provided through Microsoft Foundry hubs.

Microsoft Copilot Studio

This is incorrect because Copilot Studio focuses on agent and conversational AI creation rather than centralized AI model workspace management.

Microsoft Dataverse

This is incorrect because Dataverse is primarily a business data platform rather than a centralized AI model workspace.

An AI Builder prebuilt model

This is incorrect because prebuilt models are task-specific AI models, while summarization of arbitrary unstructured text is better aligned with prebuilt prompts.

Azure OpenAI

This is incorrect because although Azure OpenAI supports summarization, the question specifically emphasizes minimizing coding and training effort within Power Platform.

GitHub Copilot

This is incorrect because GitHub Copilot focuses on developer coding assistance rather than business text summarization workflows.

Microsoft Copilot in Power Automate

This is incorrect because Copilot assists flow creation rather than directly serving as the summarization capability requested in the requirement.

Q44. You need to design a Microsoft 365 Copilot solution to optimize employee productivity.

The solution must meet the following requirements:

- Ensure that the employees can query content stored in a subset of Microsoft SharePoint Online sites and in Teams by using natural language-based prompt actions.
- Ensure that employees receive contextually relevant responses in Microsoft 365 Copilot.

What should you include in the design?

- A. Build a Microsoft Power Automate desktop flow to read the SharePoint content and post the responses to Teams.
- B. Modify SharePoint settings.
- C. Create a custom REST API that crawls the SharePoint content.
- D. Configure Microsoft Graph access.

Answer:

D. Configure Microsoft Graph access.

Explanation:**Correct Answers:**

D. Configure Microsoft Graph access.

This option is correct because Microsoft 365 Copilot relies on Microsoft Graph to access organizational data stored across Microsoft 365 services such as SharePoint Online and Microsoft Teams. Microsoft Graph provides the contextual grounding and semantic understanding required for natural language queries and contextually relevant responses. By configuring Microsoft Graph access appropriately, employees can query authorized SharePoint and Teams content through Microsoft 365 Copilot while maintaining security trimming and contextual relevance.

Incorrect Answers:

A. Build a Microsoft Power Automate desktop flow to read the SharePoint content and post the responses to Teams.

This is incorrect because Power Automate desktop flows are not required for Microsoft 365 Copilot grounding or contextual response generation.

B. Modify SharePoint settings.

This is incorrect because SharePoint settings alone do not provide the Microsoft 365 Copilot semantic access and contextual grounding capabilities required for natural language queries.

C. Create a custom REST API that crawls the SharePoint content.

This is incorrect because Microsoft 365 Copilot already uses Microsoft Graph as the native enterprise data access layer, making custom crawling solutions unnecessary.

Q45. You need to design a Microsoft Copilot Studio agent for customer support.

The agent must securely retrieve product warranty data from a REST API. The solution must minimize development effort.

What should you include in the design?

- A. Export the agent as a managed solution and customize the agent in Power Apps.
- B. Create a custom connector in Copilot Studio and use the connector to call the API.
- C. Use a Microsoft Power Automate desktop flow to screen scrape the warranty data.
- D. Add the warranty data to the Fallback topic.

Answer:

B. Create a custom connector in Copilot Studio and use the connector to call the API.

Explanation:

Correct Answers:

B. Create a custom connector in Copilot Studio and use the connector to call the API.

This option is correct because custom connectors in Microsoft Copilot Studio are specifically designed to securely integrate external REST APIs into agents with minimal development effort. A custom connector allows the agent to authenticate securely, call the warranty REST API, retrieve product warranty information, and use the data within conversational workflows. This provides a low-code integration approach aligned with Power Platform best practices.

Incorrect Answers:

A. Export the agent as a managed solution and customize the agent in Power Apps.

This is incorrect because exporting and customizing the agent does not provide REST API integration functionality.

C. Use a Microsoft Power Automate desktop flow to screen scrape the warranty data.

This is incorrect because screen scraping is inefficient, fragile, and unnecessary when a REST API already exists.

D. Add the warranty data to the Fallback topic.

This is incorrect because the Fallback topic is intended for handling unrecognized conversations and cannot dynamically retrieve secure API data.

Q46. A company has a Microsoft Copilot Studio agent that has been in production for three months. The agent has received positive feedback from users.

You need to identify the number of questions unanswered by the agent and the number of abandoned sessions between the users and the agent.

Which Copilot Studio insights should you use?

To answer, drag the appropriate insights to the correct requirements. Each insight may be used once, more than once, or not at all.

Insights

Conversation outcomes

Generated answer rate and quality

Reactions

Survey results

The number of unanswered questions:

The number of abandoned sessions:

Answer:

Insights

Conversation outcomes

Generated answer rate and quality

Reactions

Survey results

The number of unanswered questions:

Generated answer rate and quality

The number of abandoned sessions:

Conversation outcomes

Explanation:

Correct Answers:

Generated answer rate and quality

This insight is correct for identifying unanswered questions because it measures how effectively the Copilot Studio agent generates responses and evaluates the quality of those generated answers. It helps identify situations where the agent could not provide useful or accurate answers, which directly relates to unanswered user questions.

Conversation outcomes

This insight is correct for identifying abandoned sessions because it tracks how conversations end, including completed conversations, escalations, failures, and abandoned sessions. It provides visibility into user interactions that ended before resolution or completion.

Incorrect Answers:

Reactions

This is incorrect because reactions primarily measure user sentiment and feedback such as likes or dislikes rather than unanswered questions or abandoned sessions.

Survey results

This is incorrect because surveys provide customer satisfaction feedback but do not directly measure unanswered questions or abandoned session counts.

Q47. A company has a Microsoft Foundry generative AI model.

You need to evaluate the model's output to measure the overall quality and coherence of generated responses. The evaluation must use GPT-4o as a judge and return a numeric score for each output.

Which type of metric should you use?

- A. AI quality (NLP)
- B. risk and safety
- C. Groundedness
- D. AI quality (AI assisted)

Answer:

D. AI quality (AI assisted)

Explanation:

Correct Answers:

D. AI quality (AI assisted)

This option is correct because AI quality (AI assisted) metrics use advanced AI models such as GPT-4o as evaluators or judges to assess generated responses. These metrics evaluate factors such as coherence, relevance, fluency, completeness, and overall response quality, and they return numeric scores for each generated output. This aligns exactly with the requirement to use GPT-4o as a judge for evaluating generative AI responses.

Incorrect Answers:

A. AI quality (NLP)

This is incorrect because AI quality (NLP) metrics typically use traditional natural language processing evaluation methods rather than GPT-4o-assisted evaluation.

B. risk and safety

This is incorrect because risk and safety metrics focus on harmful content, bias, toxicity, jailbreak attempts, and safety violations rather than overall response quality and coherence.

C. Groundedness

This is incorrect because groundedness measures whether responses are supported by the provided grounding data, not overall response quality or coherence.

Note: This section contains one or more sets of questions with the same scenario and problem. Each question presents a unique solution to the problem. You must determine whether the solution meets the stated goals. More than one solution in the set might solve the problem. It is also possible that none of the solutions in the set solve the problem.

In real exam, after you answer a question in this section, you will NOT be able to return. As a result, these questions do not appear on the Review Screen in exam.

Q48. A company has a Microsoft Dynamics 365 Sales environment that has Microsoft Copilot enabled. You need to customize Copilot by tailoring how opportunity summaries are generated or how they are presented to users.

Solution: You add fields to the opportunity summary. Does this meet the goal?

- A. Yes
- B. No

Answer:

A. Yes

Explanation:

Correct Answers:

A. Yes

This option is correct because Microsoft Dynamics 365 Sales Copilot opportunity summaries can be customized by modifying the fields included in the summary experience. By adding or configuring fields, organizations can tailor the generated summaries to display business-specific information that is more relevant to users. This directly affects how the summary content is generated and presented, helping align Copilot outputs with organizational requirements and sales processes.

Q49. A company has a Microsoft Dynamics 365 Sales environment that has Microsoft Copilot enabled. You need to customize Copilot by tailoring how opportunity summaries are generated or how they are presented to users.

Solution: You build Microsoft Power Automate flows to trigger customized Copilot summaries. Does this meet the goal?

- A. Yes
- B. No

Answer:

B. No

Explanation:

Correct Answers:

B. No

This option is correct because Microsoft Power Automate flows are used for workflow automation and process orchestration, but they do not directly customize how Microsoft Copilot generates or presents opportunity summaries in Dynamics 365 Sales. Opportunity summary customization is handled through supported Copilot configuration and customization capabilities within Dynamics 365 Sales, such as

configuring summary fields and presentation settings. Building Power Automate flows does not modify the native Copilot summary generation logic.

Q50. A company has a Microsoft Dynamics 365 Sales environment that has Microsoft Copilot enabled. You need to customize Copilot by tailoring how opportunity summaries are generated or how they are presented to users.

Solution: You configure AI Builder lead scoring models to influence opportunity summaries. Does this meet the goal?

- A. Yes
- B. No

Answer:

B. No

Explanation:

Correct Answers:

B. No

This option is correct because AI Builder lead scoring models are used to predict and score leads based on likelihood of conversion or other business criteria. They are intended for predictive analytics and sales prioritization scenarios, not for customizing how Microsoft Copilot generates or presents opportunity summaries in Dynamics 365 Sales. Configuring lead scoring models does not influence the structure, formatting, or content generation logic of Copilot opportunity summaries.

Q51. A company has an AI solution that uses Azure OpenAI models.

You need to recommend a governance solution that monitors and audits changes to model configurations and data usage. The solution must minimize administrative effort.

What should you include in the recommendation?

- A. Azure Monitor
- B. Azure Stream Analytics
- C. Azure API Management
- D. Azure Policy
- E. Microsoft Purview

Answer:

A. Azure Monitor

Explanation:

Correct Answers:

A. Azure Monitor

This option is correct because Azure Monitor provides native monitoring, logging, telemetry, and auditing capabilities for Azure OpenAI resources. By enabling diagnostic settings, Azure Monitor can automatically capture model deployment changes, configuration updates, request logs, token usage metrics, latency, and operational health information. This provides built-in monitoring and auditing with minimal administrative effort, making it the most appropriate solution for tracking model configurations and data usage in Azure OpenAI environments.

Incorrect Answers:**B. Azure Stream Analytics**

This is incorrect because Azure Stream Analytics is designed for real-time event processing and streaming analytics rather than AI model monitoring and auditing.

C. Azure API Management

This is incorrect because API Management focuses on API governance, security, and traffic management rather than native Azure OpenAI model configuration auditing and telemetry monitoring.

D. Azure Policy

This is incorrect because Azure Policy enforces compliance rules and deployment governance but does not provide detailed operational monitoring or auditing of model usage and configuration changes.

E. Microsoft Purview

This is incorrect because Microsoft Purview primarily focuses on enterprise data governance, compliance, classification, and responsible AI governance rather than operational monitoring of Azure OpenAI resources and telemetry.

Q52. A company plans to deploy a Microsoft Dynamics 365 Contact Center agent. You need to ensure that the agent can transfer the conversation to a live customer service representative.

Which two components should you include in the solution?

- A. Microsoft Foundry
- B. Microsoft Copilot Studio
- C. Microsoft 365 Agents Toolkit
- D. an Azure AI Bot Service skill
- E. Customer engagement hub

Answer:**B. Microsoft Copilot Studio****E. Customer engagement hub**

Explanation:**Correct Answers:****B. Microsoft Copilot Studio**

This option is correct because Microsoft Copilot Studio is used to build and configure conversational agents for Dynamics 365 Contact Center. It supports escalation and handoff scenarios where AI agents can transfer conversations to live customer service representatives when human intervention is required.

E. Customer engagement hub

This option is correct because the Customer engagement hub provides the Dynamics 365 customer service environment where live customer service representatives manage and continue customer conversations after escalation from the AI agent. It enables seamless human-agent collaboration during customer support interactions.

Incorrect Answers:**A. Microsoft Foundry**

This is incorrect because Microsoft Foundry is intended for advanced AI development and orchestration rather than Dynamics 365 Contact Center escalation workflows.

C. Microsoft 365 Agents Toolkit

This is incorrect because the Agents Toolkit is designed for Microsoft 365 extensibility and agent development scenarios rather than Contact Center live-agent escalation.

D. an Azure AI Bot Service skill

This is incorrect because Bot Service skills extend bot capabilities but are not required for transferring conversations to live representatives in Dynamics 365 Contact Center.

Q53. You use Microsoft Copilot Studio analytics to analyze the performance of a deployed Copilot Studio agent.

You need to identify which performance metrics to use to measure the following:

- The percentage of engaged sessions that are escalated to a live customer service representative
- The number of agent queries that cause a knowledge source error

What should you identify for each requirement?

The percentage of engaged sessions that are escalated to a representative:

Answer quality

Customer Satisfaction (CSAT) score

Engagement rate

Escalation rate

The number of agent queries that cause a knowledge source error:

Answer quality

Engagement rate

Escalation rate

Answer:

The percentage of engaged sessions that are escalated to a representative:

Answer quality
Customer Satisfaction (CSAT) score
Engagement rate
Escalation rate

The number of agent queries that cause a knowledge source error:

Answer quality
Engagement rate
Escalation rate

Explanation:

Correct Answers:

Escalation rate

This metric is correct because escalation rate measures the percentage of engaged sessions that are transferred or escalated from the Copilot Studio agent to a live customer service representative. It directly tracks how often the agent cannot fully resolve customer interactions independently.

Answer quality

This metric is correct because answer quality helps identify issues with generated responses, including situations where the agent fails to retrieve or use knowledge source information correctly. Knowledge source errors negatively impact generated answer quality, making this the most appropriate metric for identifying problematic queries related to grounding or retrieval failures.

Incorrect Answers:

Customer Satisfaction (CSAT) score

This is incorrect because CSAT measures user satisfaction rather than escalation percentages or knowledge source failures.

Copilot in Power Apps

This is incorrect because it is a product capability rather than an analytics metric.

Microsoft Copilot Studio

This is incorrect because it is the platform itself rather than a specific performance metric.

Engagement rate

This is incorrect because engagement rate measures how actively users interact with the agent, not escalation behavior or knowledge source errors.

Q54. A company uses Microsoft Dynamics 365 Sales to manage leads that are stored in a Microsoft Dataverse table named Lead and use non-standard terminology and custom columns.

You need to configure business terms in the Lead table so that Microsoft Copilot controls can summarize the leads efficiently. The solution must minimize administrative effort.

How should you configure the business terms?

A. Combine all the fields into one custom field.

- B. Map the field display names as business terms.
- C. Add the schema names as business terms.
- D. Create new business terms for each field.

Answer:

B. Map the field display names as business terms.

Explanation:

Correct Answers:

B. Map the field display names as business terms.

This option is correct because Microsoft Copilot controls work more effectively when business-friendly terminology is mapped to Dataverse fields. Using the field display names as business terms allows Copilot to better understand non-standard terminology and custom columns in the Lead table while minimizing administrative effort. Display names are already user-friendly and aligned with business language, making them the ideal choice for improving summarization and AI understanding.

Incorrect Answers:

A. Combine all the fields into one custom field.

This is incorrect because combining multiple fields into a single custom field would reduce data structure quality and make lead management and summarization less efficient.

C. Add the schema names as business terms.

This is incorrect because schema names are typically technical and not business-friendly, making them less effective for Copilot summarization and natural language understanding.

D. Create new business terms for each field.

This is incorrect because creating entirely new business terms for every field introduces unnecessary administrative overhead and does not minimize effort.

Q55. A company plans to deploy an AI-based customer service app that will autonomously manage interactions, escalate complex cases, and learn from historical ticket data.

You need to perform a return on AI investment (ROAI) analysis of the app deployment. The solution must ensure that the analysis is accurate.

What should you do first?

- A. Establish the AI performance metrics.
- B. Conduct an AI market benchmarking study.
- C. Model the customer experience.
- D. Identify and quantify all the development, deployment, and operating costs.

Answer:

D. Identify and quantify all the development, deployment, and operating costs.

Explanation:

Correct Answers:**D. Identify and quantify all the development, deployment, and operating costs.**

This option is correct because an accurate Return on AI Investment (ROAI) analysis must begin with establishing the full cost baseline of the AI solution. This includes development costs, deployment expenses, infrastructure, licensing, operational costs, maintenance, monitoring, and ongoing AI model usage expenses. Without understanding the total investment, it is impossible to accurately calculate ROI, cost savings, productivity gains, or business value generated by the AI deployment.

Incorrect Answers:**A. Establish the AI performance metrics.**

This is incorrect because performance metrics are important for measuring effectiveness after deployment, but ROAI analysis must first establish the financial investment baseline.

B. Conduct an AI market benchmarking study.

This is incorrect because benchmarking may provide industry comparisons, but it is not the first step required for calculating the organization's actual AI return on investment.

C. Model the customer experience.

This is incorrect because customer experience modeling helps evaluate business impact, but it does not establish the foundational cost inputs required for accurate ROAI calculations.

Q56. A company has an AI solution that uses a Microsoft Copilot Studio agent. You need to monitor the agent's performance.

The solution must meet the following requirements:

- Monitor the agent's telemetry in near-real-time (NRT).
- Download transcripts of full conversations.
- Monitor the agent's usage and performance.

What should you use for each requirement? To answer, drag the appropriate options to the correct requirements. Each option may be used once, more than once, or not at all.

Options

Monitor the agent's telemetry in NRT:

Download transcripts of full conversations:

Monitor the agent's usage and performance:

Answer:

Options

Monitor the agent's telemetry in NRT:

Download transcripts of full conversations:

Monitor the agent's usage and performance:

Explanation:**Correct Answers:****Application Insights**

This option is correct because Application Insights provides near-real-time telemetry monitoring for Microsoft Copilot Studio agents. It captures live operational data such as requests, dependencies, failures, response times, and diagnostic telemetry. This enables organizations to monitor agent behavior and performance with minimal delay.

Copilot Studio — Download transcripts

This option is correct because Copilot Studio provides built-in analytics and transcript export capabilities. Administrators can directly download full conversation transcripts from the Copilot Studio portal without requiring additional infrastructure.

Copilot Studio — Usage and performance

This option is correct because Copilot Studio contains native analytics dashboards that provide usage and performance metrics such as engagement rates, escalation rates, session outcomes, resolution rates, abandonment rates, and customer satisfaction insights.

Incorrect Answers:**Log Analytics**

This option is incorrect for this scenario because although Log Analytics can store and query telemetry data, it is not the primary built-in mechanism used for downloading full conversation transcripts from Copilot Studio.

Microsoft Power Apps

This option is incorrect because Power Apps is used for application development and integration rather than Copilot Studio telemetry monitoring or transcript analysis.

Q57. A company plans to deploy a Microsoft Copilot Studio agent that will analyze historical business data to predict customer behavior.

The data is currently stored in an Azure SQL database, flat files, APIs, and logs.

You need to organize the data into a format that can be used as a knowledge source in Copilot Studio.

What should you include in the solution?

- A. Azure AI Search
- B. Azure Data Lake Storage
- C. Azure Cosmos DB

D. Azure Translator in Foundry Tools

Answer:**A. Azure AI Search****Explanation:****Correct Answer:****A. Azure AI Search**

This option is correct because Azure AI Search is designed to ingest, index, organize, and retrieve data from multiple heterogeneous sources such as Azure SQL databases, flat files, APIs, and logs. It enables the data to be transformed into a searchable and structured knowledge source that can be used effectively by Microsoft Copilot Studio for grounding, retrieval, and AI-driven responses.

Azure AI Search is commonly used in Retrieval-Augmented Generation (RAG) architectures to provide enterprise knowledge grounding for Copilot and generative AI solutions.

Incorrect Answers:**B. Azure Data Lake Storage**

This option is incorrect because Azure Data Lake Storage is primarily a scalable storage platform for structured and unstructured data. It stores data but does not provide intelligent indexing, search, or retrieval capabilities required for Copilot Studio knowledge grounding.

C. Azure Cosmos DB

This option is incorrect because Cosmos DB is a globally distributed NoSQL database service and is not intended to organize multi-source enterprise knowledge for AI retrieval scenarios.

D. Azure Translator in Foundry Tools

This option is incorrect because Azure Translator is used for language translation services and has no role in organizing enterprise knowledge sources for predictive AI or Copilot Studio grounding.

Q58. You need to recommend a Microsoft Power Platform business solution that consolidates data from multiple internal and external data sources.

The solution must meet the following requirements:

- Provide the data as a centralized source for multiple AI systems, including Microsoft Copilot Studio agents, Dynamics 365 applications, and external AI models.
- Support built-in data classification and protection policies. Provide data for grounding and analytics.

What should you include in the recommendation?

- A. Microsoft Dataverse
- B. Azure Data Lake Storage
- C. a Microsoft Power BI semantic model
- D. Azure Cosmos DB

Answer:**A. Microsoft Dataverse**

Explanation:**Correct Answer:****A. Microsoft Dataverse**

This option is correct because Microsoft Dataverse provides a centralized, secure, and scalable business data platform for Microsoft Power Platform, Dynamics 365, Microsoft Copilot Studio agents, and external AI systems. Dataverse supports data consolidation from multiple internal and external sources while providing built-in security, governance, data classification, role-based access control, and protection policies. Dataverse is also optimized for AI grounding, analytics, and integration with Copilot and Dynamics 365 applications, making it the ideal centralized business data source for enterprise AI solutions.

Incorrect Answers:**B. Azure Data Lake Storage**

This option is incorrect because Azure Data Lake Storage is primarily a large-scale storage platform and does not provide the native business application integration, governance model, and built-in Power Platform data protection capabilities offered by Dataverse.

C. a Microsoft Power BI semantic model

This option is incorrect because a Power BI semantic model is designed for reporting and analytics consumption rather than serving as a centralized operational data platform for multiple AI systems.

D. Azure Cosmos DB

This option is incorrect because Cosmos DB is a globally distributed NoSQL database service but does not provide the built-in Power Platform governance, business data modeling, and Copilot integration capabilities required in the scenario.

Q59. You need to design a shared prompt library that will be used across multiple business units.

The solution must meet the following requirements:

- Ensure consistent AI responses with reusable formats.
- Support governance and version control.
- Minimize administrative effort.
- Minimize ongoing costs.

What should you recommend for each requirement?

Ensure consistent AI responses:

- Delegate department-specific prompt templates.
- Define standardized prompt templates.
- Maintain a prompt history.

Support governance and version control:

- Define standardized prompt templates.
- Store prompts in a Git repository.
- Categorize prompts by business function.

Answer:

Ensure consistent AI responses:

- Delegate department-specific prompt templates.
- Define standardized prompt templates.**
- Maintain a prompt history.

Support governance and version control:

- Define standardized prompt templates.
- Store prompts in a Git repository.**
- Categorize prompts by business function.

Explanation:

Correct Answers:

Define standardized prompt templates

This is correct because standardized prompt templates ensure that AI systems across multiple business units generate consistent responses by using reusable and governed prompt structures. This minimizes variation in AI outputs and reduces administrative overhead.

Store prompts in a Git repository

This is correct because Git repositories provide built-in version control, change tracking, collaboration management, rollback capability, and governance support. This approach also minimizes ongoing operational costs because Git-based repositories are lightweight and widely adopted for centralized configuration management.

Incorrect Answers:

Delegate department-specific prompt templates

This is incorrect because allowing departments to independently manage prompts can reduce response consistency and increase governance complexity.

Maintain a prompt history

This is incorrect because prompt history alone does not provide full governance, structured version control, collaboration workflows, or rollback capabilities.

Categorize prompts by business function

This is incorrect because categorization improves organization but does not directly address governance or version control requirements.

Q60. A company has a Microsoft 365 tenant in Canada and multiple Microsoft Power Platform environments in Canada and the United States.

The company plans to deploy a Microsoft Copilot Studio agent to the Canadian environment that will use:

- Microsoft Dataverse data stored in Canada
- A connector that connects to an Azure OpenAI instance in the United States

You need to ensure that the agent adheres to data residency and data movement policies before being deployed.

What should you do?

- A. Ensure that the data processed by Azure OpenAI is stored in the United States.
- B. From the Microsoft Purview portal, validate the Data loss prevention settings.
- C. Migrate the tenant to the United States.
- D. Ensure that cross-region data movement is enabled for the Canadian environment and connector dependencies.

Answer:

D. Ensure that cross-region data movement is enabled for the Canadian environment and connector dependencies.

Explanation:

Correct Answer:

D. Ensure that cross-region data movement is enabled for the Canadian environment and connector dependencies.

This option is correct because the Microsoft Copilot Studio agent is deployed in a Canadian environment while using an Azure OpenAI connector hosted in the United States. This creates a cross-region data movement scenario. To comply with data residency and data movement policies, cross-region data movement must be explicitly enabled for the environment and the associated connector dependencies before deployment.

This ensures that the Power Platform environment can legally and operationally exchange data with services hosted in another geographic region.

Incorrect Answers:

A. Ensure that the data processed by Azure OpenAI is stored in the United States.

This is incorrect because simply storing processed data in the United States does not address the requirement to validate and permit cross-region data movement between Canada and the United States.

B. From the Microsoft Purview portal, validate the Data loss prevention settings.

This is incorrect because Data Loss Prevention policies help govern connector usage and data exposure but do not specifically enable or authorize cross-region data movement for Copilot Studio environments.

C. Migrate the tenant to the United States.

This is incorrect because migrating the tenant is unnecessary and does not align with the requirement to maintain Canadian data residency while using a U.S.-based Azure OpenAI connector.

Q61. A company has an AI agent that automates the review of customer feedback stored in a cloud database. You plan to generate monthly reports from the agent's output to provide insights into customer sentiment and guide product development and marketing.

You need to ensure that the data ingested by the agent is clean and suitable for the intended use.

What should you do to prepare the data?

- A. Create a workflow in Microsoft Power Automate.
- B. Identify and address biased data.
- C. Create an agent flow in Microsoft Copilot Studio.

D. Sort the database by customer last name.

Answer:

B. Identify and address biased data.

Explanation:

Correct Answer:

B. Identify and address biased data.

This option is correct because preparing AI training and ingestion data requires ensuring that the data is accurate, representative, unbiased, and suitable for the intended business purpose. Since the AI agent analyzes customer feedback and generates sentiment-based insights that influence product development and marketing decisions, biased or unbalanced data could lead to misleading conclusions and poor business outcomes.

Identifying and correcting biased data is a critical part of responsible AI data preparation and helps improve the reliability and fairness of generated insights.

Incorrect Answers:

A. Create a workflow in Microsoft Power Automate.

This is incorrect because Power Automate workflows help automate processes but do not clean or validate data quality for AI ingestion.

C. Create an agent flow in Microsoft Copilot Studio.

This is incorrect because agent flows manage conversational or orchestration logic rather than preparing or cleansing source data.

D. Sort the database by customer last name.

This is incorrect because sorting data does not improve data quality, remove bias, or ensure suitability for AI analysis.

Q62. You need to recommend a solution to integrate a Microsoft Copilot agent with a Microsoft Dynamics 365 Contact Center chat channel.

The agent must respond to customer questions and hand off the conversation to a live customer service representative when the customer requests an escalation.

What should you recommend?

- A. Build an agent flow.
- B. Configure the Conversation Start topic.
- C. Configure a skill.
- D. Call a Microsoft Power Automate connector.
- E. Configure the Escalate topic.

Answer:

E. Configure the Escalate topic.

Explanation:**Correct Answer:****E. Configure the Escalate topic.**

This option is correct because the Escalate topic in Microsoft Copilot Studio is specifically designed to transfer conversations from the Copilot agent to a live customer service representative in Dynamics 365 Contact Center. It supports escalation workflows when a customer explicitly requests human assistance or when the agent cannot resolve the issue.

This directly satisfies the requirement for both AI-driven responses and seamless handoff to a live agent.

Incorrect Answers:**A. Build an agent flow.**

This is incorrect because agent flows help orchestrate conversation logic and automation but are not specifically responsible for live-agent escalation handling.

B. Configure the Conversation Start topic.

This is incorrect because the Conversation Start topic controls initial interaction behavior rather than escalation and handoff functionality.

C. Configure a skill.

This is incorrect because skills extend bot capabilities but are not used for transferring conversations to live customer service representatives.

D. Call a Microsoft Power Automate connector.

This is incorrect because Power Automate connectors can integrate services and automate workflows, but they are not the native mechanism for Contact Center live-agent escalation.

Q63. You are designing a testing solution for a Microsoft Copilot Studio agent that integrates with Microsoft Dynamics 365 Customer Service and Dynamics 365 Sales.

You need to design end-to-end scenarios to test the agent's ability to perform the following actions:

- Coordinate tasks and data interactions across both Dynamics 365 apps.
- Interpret user input and provide contextually relevant outputs.

Which test scenario and metric should you include in the design?

Test scenario:

- In each app, test isolated tasks without using workflows.
- Run task-based scenarios that involve both apps.
- Test visual consistency across both apps.

Metric:

- Measure the initial prompt response time for each app.
- Track the average click rate across both apps.
- Track the successful completion of cross-app tasks.

Answer:

Test scenario:

In each app, test isolated tasks without using workflows.

Run task-based scenarios that involve both apps.

Test visual consistency across both apps.

Metric:

Measure the initial prompt response time for each app.

Track the average click rate across both apps.

Track the successful completion of cross-app tasks.**Explanation:****Correct Answers:****Run task-based scenarios that involve both apps**

This is correct because the agent must coordinate tasks and data interactions across both Dynamics 365 Customer Service and Dynamics 365 Sales. End-to-end testing should therefore validate real business workflows that span both applications rather than isolated functionality.

This also helps verify whether the agent can correctly interpret user input and provide contextually relevant outputs across integrated systems.

Track the successful completion of cross-app tasks

This is correct because the most meaningful metric for end-to-end orchestration testing is whether workflows and tasks that span both applications complete successfully. This directly measures the agent's ability to coordinate data, actions, and contextual interactions across multiple Dynamics 365 applications.

Incorrect Answers:**In each app, test isolated tasks without using workflows**

This is incorrect because isolated testing does not validate cross-application orchestration or contextual workflow execution.

Test visual consistency across both apps

This is incorrect because the requirement focuses on AI task coordination and contextual relevance rather than UI consistency.

Measure the initial prompt response time for each app

This is incorrect because response time alone does not validate successful orchestration or contextual workflow completion.

Track the average click rate across both apps

This is incorrect because click rate is not a meaningful metric for validating AI-driven cross-application business task execution.

Q64. A company uses multiple Microsoft Copilot Studio agents across different channels.

You need to recommend a monitoring solution that provides comprehensive telemetry data and performance insights for the agents.

What should you include in the recommendation?

- A. Application Insights
- B. Microsoft Dynamics 365 Customer Voice
- C. Log Analytics
- D. Microsoft Purview

Answer:

A. Application Insights

Explanation:

Correct Answer:

A. Application Insights

This option is correct because Application Insights provides comprehensive telemetry, diagnostics, usage analytics, performance monitoring, dependency tracking, failures, and operational insights for Microsoft Copilot Studio agents across multiple channels.

It supports near-real-time monitoring and helps organizations analyze agent behavior, response performance, conversation flows, latency, failures, and overall operational health.

Application Insights is the primary Azure-native monitoring solution used for centralized telemetry collection and performance insights for AI applications and Copilot Studio agents.

Incorrect Answers:

B. Microsoft Dynamics 365 Customer Voice

This is incorrect because Customer Voice is designed for surveys, feedback collection, and customer satisfaction analysis rather than telemetry and operational performance monitoring.

C. Log Analytics

This is incorrect because Log Analytics is primarily used for querying and analyzing collected logs. While it can complement monitoring solutions, Application Insights is the primary telemetry and performance monitoring service for Copilot Studio agents.

D. Microsoft Purview

This is incorrect because Microsoft Purview focuses on governance, compliance, data classification, and data lineage rather than operational telemetry and performance monitoring.

Q65. A company has a Microsoft Foundry agent that summarizes customer feedback and recommends products to customers. The agent references data from multiple knowledge sources.

Users report that the agent response time is slow.

Telemetry data shows that the agent frequently reaches its token usage limit.

You need to recommend a solution to reduce token usage without degrading the quality of the generated responses.

What should you recommend?

- A. Chunk documents during indexing.
- B. Reduce the number of knowledge sources used by the agent.
- C. Reconfigure the prompts to limit the amount of retrieved content from the knowledge sources.
- D. Lower the maximum token usage limit for the responses.

Answer:

C. Reconfigure the prompts to limit the amount of retrieved content from the knowledge sources.

Explanation:

Correct Answer:

C. Reconfigure the prompts to limit the amount of retrieved content from the knowledge sources.

This option is correct because excessive retrieved grounding content from multiple knowledge sources significantly increases token consumption in Microsoft Foundry agents. By optimizing prompts and limiting the amount of retrieved content passed to the model, the organization can reduce token usage while still maintaining high-quality responses.

This approach improves efficiency without removing important knowledge sources or degrading response quality. It is a common optimization technique in Retrieval-Augmented Generation (RAG) architectures.

Incorrect Answers:

A. Chunk documents during indexing.

This is incorrect because document chunking helps improve retrieval granularity and search relevance, but by itself it does not directly control how much retrieved content is ultimately sent to the model during prompt generation.

B. Reduce the number of knowledge sources used by the agent.

This is incorrect because removing knowledge sources may reduce response quality and completeness by limiting available contextual information.

D. Lower the maximum token usage limit for the responses.

This is incorrect because simply lowering token limits may truncate responses and reduce response quality without addressing the root cause of excessive grounding content retrieval.

Q66. A company has an ecommerce support portal that uses Microsoft Dataverse.

You are designing a Microsoft Copilot Studio agent for the portal. The agent must meet the following requirements:

- Respond with a default help message when the user input is unclear.
- Initiate external processes, such as retrieving the order status, when users make specific requests.

Generative orchestration will be enabled for the solution. You need to recommend a feature for each requirement.

What should you recommend?

To answer, drag the appropriate features to the correct requirements. Each feature may be used once, more than once, or not at all.

Respond with a default help message when the user input is unclear: Initiate external processes when requested: **Answer:**Respond with a default help message when the user input is unclear: Initiate external processes when requested: **Explanation:****Correct Answers:****The Fallback topic**

This is correct because the Fallback topic in Microsoft Copilot Studio is triggered when the agent cannot confidently understand or match the user's input. It is specifically designed to provide default help messages, clarification prompts, or recovery guidance when user input is unclear.

A tool (connector)

This is correct because tools and connectors allow Copilot Studio agents to invoke external systems, APIs, workflows, and business processes such as retrieving order status information or initiating backend operations.

With generative orchestration enabled, the agent can intelligently determine when to invoke the connector based on user intent.

Incorrect Answers:**A trigger phrase**

This is incorrect because trigger phrases are used to activate specific topics and are not designed for handling unclear user input.

A skill

This is incorrect because skills extend capabilities between bots but are not the primary mechanism for initiating external business processes in Copilot Studio.

The Escalate topic

This is incorrect because the Escalate topic is used for transferring conversations to human agents rather than providing fallback responses or invoking external processes.

Q67. A company has an AI business solution.

You need to extend the solution so that Microsoft 365 Copilot can invoke external logic hosted in Azure services.

What should you include in the solution?

- A. Microsoft Copilot Studio skills
- B. Microsoft Power Platform connectors
- C. custom engine agents

Answer:

B. Microsoft Power Platform connectors

Explanation:

Correct Answer:

B. Microsoft Power Platform connectors

This option is correct because Microsoft Power Platform connectors enable Microsoft 365 Copilot to securely connect to external Azure-hosted services, APIs, workflows, and business logic. Connectors provide a low-code integration mechanism that allows Copilot solutions to invoke external functionality hosted in Azure services such as Azure Functions, Logic Apps, APIs, and other backend systems.

This is the standard integration approach for extending Microsoft 365 Copilot with external enterprise logic while minimizing development effort.

Incorrect Answers:

A. Microsoft Copilot Studio skills

This option is incorrect because skills are primarily used to extend conversational capabilities between bots and agents rather than directly integrating Microsoft 365 Copilot with external Azure-hosted business logic.

C. custom engine agents

This option is incorrect because custom engine agents are not the standard Microsoft integration mechanism for invoking external Azure services from Microsoft 365 Copilot.

Q68. A company processes invoices stored across multiple systems in multiple formats.

You need to implement an AI solution to automate the invoice processing. The solution must meet the following requirements:

- Automate multi-step invoice processing tasks, including document analysis, data validation, and approval routing.
- Enable users to interact directly via Microsoft Teams to review and approve invoices.
- Minimize development efforts to define and customize approval workflows.

What should you include in the solution?

- A. Azure Document Intelligence in Foundry Tools and Azure Logic Apps
- B. a SharePoint agent
- C. Microsoft Copilot Studio and AI Builder

D. Azure OpenAI and Azure Functions

Answer:

C. Microsoft Copilot Studio and AI Builder

Explanation:

Correct Answer:

C. Microsoft Copilot Studio and AI Builder

This option is correct because Microsoft Copilot Studio and AI Builder together provide a low-code AI automation solution that can automate invoice processing workflows with minimal development effort. AI Builder can analyze invoices, extract document data, and validate invoice information from multiple document formats. Microsoft Copilot Studio can orchestrate multi-step workflows, integrate approval routing, and enable users to interact through Microsoft Teams for reviewing and approving invoices.

This combination directly satisfies all the requirements:

document analysis,
data validation,
approval routing,
Teams-based interaction,
and low-code workflow customization.

Incorrect Answers:

A. Azure Document Intelligence in Foundry Tools and Azure Logic Apps

This option is incorrect because although Document Intelligence and Logic Apps can automate invoice processing, they typically require more custom integration and workflow development effort compared to Copilot Studio and AI Builder.

B. a SharePoint agent

This option is incorrect because a SharePoint agent is not designed for enterprise invoice processing automation, document extraction, or approval workflow orchestration.

D. Azure OpenAI and Azure Functions

This option is incorrect because Azure OpenAI and Azure Functions would require significant custom development effort and do not provide the low-code workflow and approval capabilities requested in the scenario.

Q69. A company has a Microsoft Copilot Studio agent for customer support.

You are reviewing and validating the following prompts:

- A prompt that has instructions to "help the customer as best you can"
- A prompt that helps retrieve product information from a knowledge base

You need to ensure that the agent delivers consistent and accurate responses.

What should you do for each prompt?

A prompt that has instructions to “help the customer as best you can”:

- Add filler words to make the prompt sound more natural and conversational.
- Keep the prompt vague to enable model flexibility.
- Rewrite the prompt with clear and task-specific instructions.

A prompt that helps retrieve product information from a knowledge base:

- Add several open-ended questions to give the model broader context.
- Use responses with only reference sources and limit the response scope.
- Remove the knowledge source so that the model responds freely with general product information.

Answer:

A prompt that has instructions to “help the customer as best you can”:

- Add filler words to make the prompt sound more natural and conversational.
- Keep the prompt vague to enable model flexibility.
- Rewrite the prompt with clear and task-specific instructions.**

A prompt that helps retrieve product information from a knowledge base:

- Add several open-ended questions to give the model broader context.
- Use responses with only reference sources and limit the response scope.**
- Remove the knowledge source so that the model responds freely with general product information.

Explanation:

Correct Answers:

Rewrite the prompt with clear and task-specific instructions

This is correct because vague prompts such as “help the customer as best you can” can produce inconsistent and unpredictable outputs. Clear, task-specific prompts improve response consistency, accuracy, and reliability by explicitly defining the expected behavior and response boundaries.

Use responses with only reference sources and limit the response scope

This is correct because grounding responses strictly on approved knowledge base sources helps ensure factual accuracy and reduces hallucinations. Limiting the response scope further improves consistency and prevents the model from generating unsupported information.

Incorrect Answers:

Add filler words to make the prompt sound more natural and conversational

This is incorrect because filler words do not improve prompt precision or response consistency.

Keep the prompt vague to enable model flexibility

This is incorrect because vague prompts increase variability and reduce response reliability.

Add several open-ended questions to give the model broader context

This is incorrect because overly broad prompts can increase irrelevant or inconsistent responses.

Remove the knowledge source so that the model responds freely with general product information

This is incorrect because removing grounding sources increases the risk of hallucinations and inaccurate responses.

Q70. A company has a portfolio of AI initiatives at different stages of development. You need to recommend a structured approach to evaluating the return on AI investment (ROAI) across all the initiatives. The solution must balance immediate results with long-term values and strategic innovations.

What should you include in the recommendation?

- A. a simple cost and benefit analysis
- B. a horizon-based framework
- C. the internal rate of return (IRR) function
- D. a prioritization grid

Answer:

B. a horizon-based framework

Explanation:

Correct Answer:

B. a horizon-based framework

This option is correct because a horizon-based framework is designed to evaluate initiatives across different stages of maturity and investment timelines. It helps organizations balance short-term operational value, medium-term transformation goals, and long-term strategic innovation.

Since the company has multiple AI initiatives at different stages of development, a horizon-based framework provides a structured approach for evaluating return on AI investment across the entire portfolio while considering both immediate and future business value.

Incorrect Answers:

A. a simple cost and benefit analysis

This option is incorrect because a simple cost-benefit analysis mainly evaluates immediate financial gains and does not effectively measure long-term innovation or strategic AI value.

C. the internal rate of return (IRR) function

This option is incorrect because IRR is a financial calculation used to estimate profitability, but it does not provide a comprehensive framework for evaluating AI initiatives across multiple time horizons and strategic goals.

D. a prioritization grid

This option is incorrect because a prioritization grid helps rank initiatives but does not provide a structured ROAI methodology that balances short-term outcomes with long-term innovation.

Q71. A company has Microsoft Copilot Studio agents.

The company plans to deploy custom connectors across development, test and production environments. You need to design an application lifecycle management (ALM) process to ensure consistency and prevent direct editing in production.

Which two actions should you include in the design?

- A. Deploy managed solutions to production.
- B. Deploy unmanaged solutions to production.
- C. Manually rebuild the agents in each environment.
- D. Move the agents between the environments by using data export and import.
- E. Include agents and connectors in a solution.

Answer:

A. Deploy managed solutions to production.

E. Include agents and connectors in a solution.

Explanation:

Correct Answers:

A. Deploy managed solutions to production

This option is correct because managed solutions are intended for production environments. They help prevent direct editing of components in production, enforce governance, and ensure controlled deployments through the ALM pipeline.

E. Include agents and connectors in a solution

This option is correct because adding agents and custom connectors into a solution enables consistent packaging, deployment, versioning, and lifecycle management across development, test, and production environments.

This is the recommended ALM approach for Microsoft Copilot Studio and Power Platform components.

Incorrect Answers:

B. Deploy unmanaged solutions to production

This option is incorrect because unmanaged solutions allow direct editing in production, which violates the requirement to prevent uncontrolled modifications.

C. Manually rebuild the agents in each environment

This option is incorrect because manual rebuilding increases administrative effort, introduces inconsistencies, and does not support proper ALM governance.

D. Move the agents between the environments by using data export and import

This option is incorrect because exporting and importing data does not provide structured ALM, version control, or connector deployment consistency.

Q72. A company uses Microsoft Dynamics 365 finance and operations apps.

The company plans to use Microsoft Copilot in-app help and guidance to generate responses for internal business processes.

You need to add an additional knowledge source for the business processes. The solution must NOT add new topics to the Copilot agent for the finance and operations apps.

Which knowledge source should you add?

- A. Microsoft Dataverse

- B. a public website
- C. Azure AI Search
- D. a file upload

Answer:

D. a file upload

Explanation:

Correct Answer:

D. a file upload

This option is correct because Microsoft Copilot in-app help and guidance for Dynamics 365 finance and operations apps supports uploaded files as knowledge sources. Business process documents, operational manuals, and internal guidance documents can be uploaded directly and used by Copilot to generate contextual responses.

This approach satisfies the requirement to add additional knowledge sources without creating new Copilot topics.

Incorrect Answers:

A. Microsoft Dataverse

This option is incorrect because Dataverse is primarily intended for structured business application data rather than document-based knowledge grounding for in-app help scenarios.

B. a public website

This option is incorrect because the requirement focuses on internal business process guidance rather than externally hosted public content.

C. Azure AI Search

This option is incorrect because Azure AI Search is generally used for advanced enterprise retrieval architectures and would add unnecessary complexity for this scenario.

Q73. You are designing a testing solution for Microsoft Copilot Studio agents.

You need to validate prompt engineering best practices to ensure that the agents generate accurate and contextually relevant responses.

Which prompt validation techniques and metrics should you include in the solution?

Prompt validation techniques:

- Exclude domain-specific terminology from the prompts.
- Use prompts that have varied phrasing.
- Use only simple, one-word prompts.

Metrics:

- The number of words generated per response
- Response relevance and accuracy
- The response generation time

Answer:

Prompt validation techniques:

- Exclude domain-specific terminology from the prompts.
- Use prompts that have varied phrasing.**
- Use only simple, one-word prompts.

Metrics:

- The number of words generated per response
- Response relevance and accuracy**
- The response generation time

Explanation:

Correct Answers:

Use prompts that have varied phrasing

This option is correct because validating prompts with different wording and phrasing helps ensure that Microsoft Copilot Studio agents can consistently interpret user intent and generate accurate, contextually relevant responses across diverse conversational styles.

Testing varied phrasing is a core prompt engineering best practice because real users ask the same question in many different ways.

Response relevance and accuracy

This option is correct because the primary goal of prompt validation is ensuring that responses are both contextually appropriate and factually correct. Measuring relevance and accuracy directly evaluates whether the prompt engineering strategy is successful.

Incorrect Answers:

Exclude domain-specific terminology from the prompts

This option is incorrect because domain-specific terminology is often essential for accurate contextual understanding in enterprise AI scenarios.

Use only simple, one-word prompts

This option is incorrect because real-world user interactions are conversational and contextual, not limited to isolated keywords.

The number of words generated per response

This option is incorrect because response length alone does not measure correctness or contextual quality.

The response generation time

This option is incorrect because although performance is important, the question specifically focuses on validating accurate and contextually relevant responses.

Q74. A company has multiple AI models that support generation of sales transactions.

Each release of the models must be reviewed by a security and compliance team before being deployed to the production environment. The security and compliance team must have access to prior versions to properly determine potential exposures introduced.

You need to recommend a solution to evaluate the impact of each deployment to production. The solution must enhance business continuity.

What should you recommend?

- A. Create a central model registry that uses version history.
- B. Establish a promotion process by using a quality gate.
- C. Implement version control for all the AI system components.
- D. Track model retirement schedules to prevent service disruptions.

Answer:

A. Create a central model registry that uses version history.

Explanation:

Correct Answer:

A. Create a central model registry that uses version history.

This option is correct because the scenario specifically requires the security and compliance team to review prior model versions before approving deployments to production.

A centralized model registry with version history provides:

traceability,
version comparison,
governance,
auditability,
and rollback support.

It enables the organization to evaluate how each model release differs from previous versions and helps identify new risks or compliance exposures introduced in a release.

A model registry also improves business continuity because previous approved versions can be restored if issues occur after deployment.

Incorrect Answers:

B. Establish a promotion process by using a quality gate.

This option is incorrect because quality gates help enforce approval workflows, but they do not provide centralized version tracking and historical model comparison capabilities required in the scenario.

C. Implement version control for all the AI system components.

This option is incorrect because although version control is important, the requirement specifically focuses on reviewing prior model versions and evaluating deployment impact through centralized governance and model lifecycle visibility.

D. Track model retirement schedules to prevent service disruptions.

This option is incorrect because retirement tracking focuses on lifecycle maintenance and decommissioning rather than deployment impact analysis and version comparison.

Q75. A company has an AI business solution that uses Microsoft Copilot Studio agents. You need to recommend prompt best practices to improve the effectiveness of agent interactions.

Which two actions should you include in the recommendation?

- A. Track the duration of the average user session.
- B. Analyze the prompt length distribution.
- C. Regularly test and refine the prompts based on user input.
- D. Use clear and specific instructions in the prompts.
- E. Measure system resource usage during prompt processing.

Answer:

C. Regularly test and refine the prompts based on user input.

D. Use clear and specific instructions in the prompts.

Explanation:

Correct Answers:

C. Regularly test and refine the prompts based on user input

This option is correct because prompt engineering is an iterative process. Continuously testing and refining prompts based on real user interactions helps improve response quality, contextual accuracy, and conversational effectiveness over time.

D. Use clear and specific instructions in the prompts

This option is correct because clear and precise prompts reduce ambiguity and help Microsoft Copilot Studio agents generate more accurate, relevant, and consistent responses.

Specific instructions are a fundamental prompt engineering best practice.

Incorrect Answers:

A. Track the duration of the average user session

This option is incorrect because session duration is an analytics metric and does not directly improve prompt effectiveness.

B. Analyze the prompt length distribution

This option is incorrect because prompt length alone does not determine prompt quality or interaction effectiveness.

E. Measure system resource usage during prompt processing

This option is incorrect because resource usage measures infrastructure performance rather than prompt engineering quality.

Q76. A company plans to implement an AI business solution for a consumer goods company.

You need to create agents that meet the following requirements:

- Orchestrate the sales order fulfillment and shipping of goods to customers.
- Analyze historical data and trends to replenish stock.

Which type of agent should you use for each requirement? To answer, drag the appropriate agent types to the correct requirements. Each agent type may be used once, more than once, or not at all.

Agent types

Autonomous

Prompt-and-response

Task

Orchestrate the sales order fulfillment and shipping:

Analyze historical data and trends:

Answer:**Agent types**

Autonomous

Prompt-and-response

Task

Orchestrate the sales order fulfillment and shipping:

Analyze historical data and trends:

Autonomous**Task****Explanation:****Correct Answers:****Autonomous**

This is correct for orchestrating sales order fulfillment and shipping because autonomous agents are designed to independently coordinate complex, multi-step business workflows across multiple systems.

Sales order fulfillment and shipping involve:

inventory validation,
payment processing,
shipment coordination,
logistics integration,
status tracking,
and exception handling.

These processes require dynamic decision-making and workflow orchestration capabilities, which are core characteristics of autonomous agents.

Task

This is correct for analyzing historical data and trends because this requirement represents a focused and well-defined business function.

The agent needs to:

analyze historical sales and inventory data,

identify trends,

and generate replenishment insights or recommendations.

Task agents are optimized for structured, bounded operations with a specific objective and predictable output.

Incorrect Answer:**Prompt-and-response**

This option is incorrect because prompt-and-response agents are primarily intended for conversational interactions and user-driven Q&A scenarios.

They do not independently orchestrate enterprise workflows or execute structured analytical business processes.

Q77. A company has a Microsoft Power Platform environment that contains Microsoft Dataverse data. You create a Microsoft Copilot Studio agent named Agent1 that processes the Dataverse data. You discover that Agent1 fails to return relevant or accurate results. You need to improve the quality and reliability of data grounding.

What should you do?

- A. Retrain Agent1.
- B. Verify and cleanse the Dataverse data.
- C. Use an adaptive card in Agent1.
- D. Add example user inputs to the training data of Agent1.

Answer:

B. Verify and cleanse the Dataverse data.

Explanation:**Correct Answer:**

B. Verify and cleanse the Dataverse data.

This option is correct because grounding quality depends heavily on the quality, consistency, completeness, and accuracy of the source data.

If Agent1 is returning irrelevant or inaccurate responses while processing Microsoft Dataverse data, the most effective solution is to validate and cleanse the underlying data.

Data cleansing improves:

data consistency,

accuracy,

completeness,

standardization,
and relevance.

Better source data directly improves grounding quality and the reliability of AI-generated responses.

Incorrect Answers:

A. Retrain Agent1

This option is incorrect because Copilot Studio agents primarily rely on grounding and orchestration rather than traditional model retraining. Poor grounding results are usually caused by poor-quality source data rather than insufficient training.

C. Use an adaptive card in Agent1

This option is incorrect because adaptive cards improve the user interface and interaction experience but do not improve grounding quality or response accuracy.

D. Add example user inputs to the training data of Agent1

This option is incorrect because example inputs may help conversational understanding, but they do not resolve inaccurate or unreliable grounding caused by poor Dataverse data quality.

Q78. You are designing an AI business solution that contains the following components:

- A Microsoft Power Automate workflow
- A Microsoft Copilot Studio agent A Microsoft Dataverse database
- A Microsoft Power Apps app

As part of the application lifecycle management (ALM) process, you plan to package the components, so that they can be deployed to other environments as a group.

You need to recommend a solution that supports versioning, dependencies, and deployments.

What should you include in the recommendation?

- A. GitHub Actions
- B. Azure DevOps
- C. Microsoft Power Platform solutions

Answer:

C. Microsoft Power Platform solutions

Explanation:

Correct Answer:

C. Microsoft Power Platform solutions

This option is correct because Microsoft Power Platform solutions are specifically designed for application lifecycle management in Power Platform environments.

Solutions allow organizations to package related components together, such as Power Automate workflows, Copilot Studio agents, Dataverse components, and Power Apps applications, so they can be deployed consistently across environments.

Power Platform solutions support versioning, dependency tracking, managed and unmanaged deployment models, and environment-to-environment deployments, which directly satisfies the ALM requirements in the scenario.

Incorrect Answers:**A. GitHub Actions**

This option is incorrect because GitHub Actions is mainly used for CI/CD automation and pipeline orchestration. It is not the native packaging and dependency-management mechanism for Power Platform components.

B. Azure DevOps

This option is incorrect because Azure DevOps can automate deployments and manage pipelines, but the actual grouping, packaging, dependency handling, and transport of Power Platform components is handled through Power Platform solutions.

Q79. A company uses Microsoft Dynamics 365 Supply Chain Management.

You are designing an AI supply chain process that meets the following requirements:

- Provides managers with AI-driven insights that surface key information from customer orders
- Helps planners use AI to anticipate future product needs more accurately

You need to recommend which Microsoft Copilot features to include in the design.

What should you recommend for each requirement?

Provide AI-driven insights from customer orders:

▼
AI Summaries with Copilot
Generative insights for Demand planning
The Customer credit and collections workspace
Workload insights with Copilot

Anticipate future product needs:

▼
Generative insights for Demand planning
Microsoft Power BI
Product information management
The Supplier Communications Agent

Answer:

Provide AI-driven insights from customer orders:

AI Summaries with Copilot

Generative insights for Demand planning

The Customer credit and collections workspace

Workload insights with Copilot

Anticipate future product needs:

Generative insights for Demand planning

Microsoft Power BI

Product information management

The Supplier Communications Agent

Explanation:

Correct Answers:

AI Summaries with Copilot

This is correct because AI Summaries with Copilot helps managers quickly surface and understand key information from customer orders, operational records, and related business data. It provides AI-generated summaries that improve visibility and decision-making efficiency.

This directly satisfies the requirement to provide AI-driven insights from customer orders.

Generative insights for Demand planning

This is correct because Generative insights for Demand planning uses AI-driven forecasting and analytical capabilities to help planners anticipate future product demand more accurately.

It analyzes historical trends, demand signals, and planning data to improve forecasting and inventory planning decisions.

This directly satisfies the requirement to anticipate future product needs.

Incorrect Answers:

The Customer credit and collections workspace

This option is incorrect because it focuses on financial collections and customer credit management rather than customer-order insights and demand forecasting.

Workload insights with Copilot

This option is incorrect because it focuses on operational workload visibility rather than summarizing customer-order information.

Microsoft Power BI

This option is incorrect because although Power BI provides analytics and visualization capabilities, the question specifically asks for Microsoft Copilot features.

Product information management

This option is incorrect because it manages product master data rather than forecasting future demand.

The Supplier Communications Agent

This option is incorrect because it focuses on supplier interactions and communications rather than AI-driven demand forecasting.

Q80. You need to recommend a security solution for agents in a Microsoft Power Platform environment. The agents must use only approved connectors and services. The solution must prevent the agents from accessing sensitive data.

What should you recommend?

- A. Configure Azure Monitor to capture connector activity logs.
- B. Enable a Microsoft Dataverse audit.
- C. Deploy data loss prevention (DLP) policies in Power Platform.
- D. Enable customer-managed keys in Microsoft Dataverse.

Answer:

C. Deploy data loss prevention (DLP) policies in Power Platform.

Explanation:

Correct Answer:

C. Deploy data loss prevention (DLP) policies in Power Platform.

This option is correct because DLP policies in Microsoft Power Platform are specifically designed to control which connectors and services can be used by applications, flows, and agents.

DLP policies help organizations restrict the use of unapproved connectors, prevent data movement between trusted and untrusted services, and protect sensitive information from unauthorized access or exposure. This directly satisfies the requirement that agents must use only approved connectors and services while preventing access to sensitive data.

Incorrect Answers:

A. Configure Azure Monitor to capture connector activity logs

This option is incorrect because Azure Monitor provides monitoring and logging capabilities only. It does not enforce connector restrictions or block sensitive data access.

B. Enable a Microsoft Dataverse audit

This option is incorrect because Dataverse auditing tracks activities and data changes, but it does not control which connectors or services agents are allowed to use.

D. Enable customer-managed keys in Microsoft Dataverse

This option is incorrect because customer-managed keys help control encryption ownership and key management, but they do not enforce connector governance or prevent data movement between services.

Q81. A company extends Copilot in Microsoft Dynamics 365 Customer Service.

You need to recommend an automated application lifecycle management (ALM) process so that the Copilot components can be safely developed, tested, and promoted to production.

Which two actions should you include in the ALM process?

- A. Use an unmanaged solution in production.
- B. Rebuild the agents in each environment.
- C. Use Microsoft Power Platform pipelines.

- D. Include the components in a solution.
- E. Store the agent transcripts in source control.

Answer:

C. Use Microsoft Power Platform pipelines.

D. Include the components in a solution.

Explanation:

Correct Answers:

C. Use Microsoft Power Platform pipelines

This option is correct because Power Platform pipelines provide a standardized and automated ALM mechanism for deploying components across development, test, and production environments.

Pipelines help automate:

environment promotion,
deployment validation,
solution movement,
and governance controls.

This directly supports safe development, testing, and production promotion of Copilot components.

D. Include the components in a solution

This option is correct because Power Platform solutions are the foundational packaging mechanism for ALM in Microsoft Power Platform and Dynamics 365 environments.

Solutions allow Copilot components to be grouped, versioned, dependency-tracked, and transported consistently across environments.

This is required for proper lifecycle management and deployment automation.

Incorrect Answers:

A. Use an unmanaged solution in production

This option is incorrect because production environments should use managed solutions to prevent direct editing and maintain governance and deployment integrity.

B. Rebuild the agents in each environment

This option is incorrect because rebuilding agents manually increases administrative effort, introduces inconsistencies, and bypasses proper ALM practices.

E. Store the agent transcripts in source control

This option is incorrect because transcripts are operational conversation records and are not ALM deployment artifacts.

Q82. You are designing a Microsoft Copilot Studio agent that uses a custom Microsoft Foundry model to generate responses.

You need to ensure that the agent can securely connect to and invoke the custom model during user interactions.

What should you include in the design?

- A. Configure the agent to use classic orchestration.
- B. Create a connection to Microsoft Foundry in the agent.
- C. Add the Microsoft Foundry model as a Copilot Studio skill.
- D. Create a custom engine agent.

Answer:

B. Create a connection to Microsoft Foundry in the agent.

Explanation:

Correct Answer:

B. Create a connection to Microsoft Foundry in the agent.

This option is correct because Microsoft Copilot Studio agents securely invoke custom Microsoft Foundry models through configured connections. Creating a connection to Microsoft Foundry enables the agent to authenticate, access, and use the custom model during runtime interactions.

This approach provides secure integration between Copilot Studio and Microsoft Foundry while supporting governed AI model access during user conversations.

Incorrect Answers:

A. Configure the agent to use classic orchestration

This option is incorrect because orchestration mode controls how the agent manages conversations and topics. It does not establish secure connectivity to a Microsoft Foundry model.

C. Add the Microsoft Foundry model as a Copilot Studio skill

This option is incorrect because skills are used to extend conversational capabilities between agents and bots, not for securely connecting to external AI models hosted in Microsoft Foundry.

D. Create a custom engine agent

This option is incorrect because custom engine agents are not the standard integration mechanism for securely invoking Microsoft Foundry models from Copilot Studio.

Q83. A company has a Microsoft Copilot Studio prompt-and-response agent.

You need to ensure that the agent meets the following requirements:

- Provides effective and relevant responses
- Provides conversational outcomes

Which metric should you use for each requirement?

Provides effective and relevant responses:

▼

Generated answer rate and quality

Reactions

Tool use

Provides conversational outcomes:

▼

Satisfaction

Tool use

Topics by outcome

Answer:

Provides effective and relevant responses:

▼

Generated answer rate and quality

Reactions

Tool use

Provides conversational outcomes:

▼

Satisfaction

Tool use

Topics by outcome

Explanation:

Correct Answers:

Generated answer rate and quality

This metric is used to evaluate how effectively the Microsoft Copilot Studio agent generates accurate, relevant, and useful responses during user interactions. It measures the quality and success rate of AI-generated answers and directly aligns with the requirement to provide effective and relevant responses.

Topics by outcome

This metric is used to analyze how conversations progress and conclude across different topics and interaction paths. It helps determine whether conversations are successfully resolved, escalated, abandoned, or completed, which directly supports the requirement to provide conversational outcomes.

Incorrect Answers:

Reactions

This option is incorrect because reactions primarily capture user feedback indicators such as likes or dislikes. While useful for sentiment analysis, they do not directly measure response relevance or conversational effectiveness.

Tool use

This option is incorrect because tool-use metrics focus on how frequently tools, connectors, or actions are invoked during conversations. They do not measure the quality of responses or conversation outcomes.

Satisfaction

This option is incorrect because satisfaction metrics measure user sentiment or CSAT-style feedback rather than tracking whether conversational objectives or outcomes were achieved.

Q84. A company is designing a Microsoft Power Platform solution to reduce the manual steps of a business process by deploying an existing AI model.

You need to calculate the return on AI investment (ROAI) by identifying the metadata and telemetry of the solution.

What should you use?

- A. Microsoft Power Platform admin center
- B. Success by Design
- C. the Business value toolkit
- D. Microsoft Cloud Adoption Framework for Azure

Answer:

C. the Business value toolkit

Explanation:

Correct Answer:

C. the Business value toolkit

This option is correct because the Business value toolkit is specifically designed to help organizations evaluate and measure return on AI investment (ROAI) and business outcomes for Microsoft Power Platform and AI solutions.

The toolkit helps identify and measure:

business value metrics,
telemetry,
usage insights,
operational impact,
productivity improvements,
and financial outcomes.

This directly supports calculating ROAI for an AI-enabled Power Platform solution.

Incorrect Answers:

A. Microsoft Power Platform admin center

This option is incorrect because the Power Platform admin center is primarily used for environment administration, governance, monitoring, and management. It is not specifically intended for structured ROAI evaluation.

B. Success by Design

This option is incorrect because Success by Design provides architectural and implementation guidance for Power Platform projects, but it is not a toolkit for calculating ROAI through metadata and telemetry analysis.

D. Microsoft Cloud Adoption Framework for Azure

This option is incorrect because the Cloud Adoption Framework focuses on cloud adoption strategy, governance, and operational guidance rather than AI investment-return analysis for Power Platform solutions.

Q85. A company has a Microsoft Copilot Studio agent that uses generative AI to assist Microsoft Dynamics 365 Customer Service representatives.

The agent currently exhibits a low resolution rate and a high escalation rate. You need to identify the issue.

What should you use?

- A. the Agent dashboard of Dynamics 365 Customer Service historical analytics
- B. the Insights tab from the Search & intelligence settings of the Microsoft 365 admin center
- C. the Copilot hub in the Power Platform admin center
- D. the Analytics tab in Copilot Studio

Answer:

D. the Analytics tab in Copilot Studio

Explanation:

Correct Answer:

D. the Analytics tab in Copilot Studio

This option is correct because the Analytics tab in Microsoft Copilot Studio provides detailed conversational analytics and performance insights for Copilot agents.

It includes metrics such as:

resolution rate,
escalation rate,
conversation outcomes,
session analytics,
user engagement,
and generated answer quality.

Since the issue involves a low resolution rate and a high escalation rate, Copilot Studio analytics is the appropriate tool to identify and analyze the root cause.

Incorrect Answers:

A. the Agent dashboard of Dynamics 365 Customer Service historical analytics

This option is incorrect because historical analytics in Dynamics 365 Customer Service focuses more on customer service operational reporting and agent performance rather than detailed Copilot Studio conversational analytics.

B. the Insights tab from the Search & intelligence settings of the Microsoft 365 admin center

This option is incorrect because this area is related to Microsoft 365 search and intelligence features, not Copilot Studio conversational performance analysis.

C. the Copilot hub in the Power Platform admin center

This option is incorrect because the Copilot hub mainly provides governance and administrative oversight rather than detailed agent conversation analytics and escalation diagnostics.

Q86. A company has a Microsoft Foundry project that uses a single agent and a single prompt to complete a series of tasks.

The agent encounters the following issues:

- It frequently produces incomplete results.
- It struggles with domain-specific reasoning.
- Agent response times are remarkably slow.

You need to recommend a solution to improve the overall performance and accuracy of the agent.

What should you include in the recommendation? To answer, drag the appropriate actions to the correct requirements. Each action may be used once, more than once, or not at all.

Actions

Add a grounding data source.

Add a prebuilt connector.

Move to a multi-agent architecture.

Upgrade to a larger generative AI model.

To improve performance:

To improve accuracy:

Answer:**Actions**

Add a grounding data source.

Add a prebuilt connector.

Move to a multi-agent architecture.

Upgrade to a larger generative AI model.

To improve performance:

Move to a multi-agent architecture.

To improve accuracy:

Add a grounding data source.

Explanation:**Correct Answers:****To improve performance: Move to a multi-agent architecture**

The current solution uses a single agent and a single prompt for multiple tasks, which causes slow responses and incomplete processing. A multi-agent architecture distributes responsibilities across specialized agents, improving efficiency, scalability, and overall performance.

To improve accuracy: Add a grounding data source

The agent struggles with domain-specific reasoning, which indicates that it lacks relevant contextual knowledge. Adding a grounding data source improves the accuracy and reliability of responses by allowing the agent to reference trusted enterprise or domain-specific data.

Incorrect Answers:

Add a prebuilt connector

Prebuilt connectors help integrate external systems and services, but they do not directly address reasoning quality, response accuracy, or overall agent performance.

Upgrade to a larger generative AI model

A larger model may improve reasoning slightly, but it typically increases latency and cost. It does not address the architectural inefficiencies caused by using a single agent for all tasks.

Q87. A company plans to deploy a Microsoft Foundry agent.

You need to recommend an application lifecycle management (ALM) process to ensure that the agent evaluates against baseline accuracy metrics before being deployed.

What should you recommend?

- A. Configure GitHub Actions for new agent versions.
- B. Deploy each new agent version directly to production.
- C. Use Observability in Foundry Control Plane with evaluation and drift monitoring.
- D. Enable Application Insights and use Azure Monitor.

Answer:

C. Use Observability in Foundry Control Plane with evaluation and drift monitoring.

Explanation:

Correct Answers:

C. Use Observability in Foundry Control Plane with evaluation and drift monitoring.

Observability in the Foundry Control Plane provides built-in evaluation and drift monitoring capabilities that help validate agent performance against baseline accuracy metrics before deployment. This supports a reliable ALM process by continuously tracking quality, consistency, and model behavior over time.

Incorrect Answers:

A. Configure GitHub Actions for new agent versions.

GitHub Actions helps automate CI/CD workflows, but it does not by itself evaluate agent accuracy or monitor drift against baseline metrics.

B. Deploy each new agent version directly to production.

Direct deployment to production bypasses validation and testing processes, increasing the risk of inaccurate or unstable agent behavior.

D. Enable Application Insights and use Azure Monitor.

Application Insights and Azure Monitor focus on telemetry, logs, and operational monitoring. They do not provide specialized AI evaluation and drift monitoring capabilities for Foundry agents.

Q88. A global manufacturing company wants to integrate AI across its operations. The CTO has asked you to lead the initiative.

The company has no existing AI governance framework and limited AI experience among its staff.

Which approach should you recommend as the first step?

- A. Deploy Copilot Studio agents to automate the most time-consuming business processes immediately
- B. Implement the AI adoption process from the Cloud Adoption Framework for Azure, starting with defining an AI strategy and establishing governance
- C. Build custom AI models in Microsoft Foundry to demonstrate the potential of AI to leadership
- D. Purchase prebuilt Dynamics 365 agents and deploy them across all departments simultaneously

Answer:

B. Implement the AI adoption process from the Cloud Adoption Framework for Azure, starting with defining an AI strategy and establishing governance

Explanation:

Correct Answers:

B. Implement the AI adoption process from the Cloud Adoption Framework for Azure, starting with defining an AI strategy and establishing governance

Since the company has no AI governance framework and limited AI experience, the first priority should be establishing a structured AI adoption strategy and governance model. The AI adoption process in the Cloud Adoption Framework for Azure provides guidance for governance, risk management, organizational readiness, and responsible AI practices before large-scale deployment.

Incorrect Answers:

A. Deploy Copilot Studio agents to automate the most time-consuming business processes immediately

Deploying AI agents immediately without governance, strategy, or organizational readiness can lead to security, compliance, and operational risks.

C. Build custom AI models in Microsoft Foundry to demonstrate the potential of AI to leadership

Building custom AI models is premature when the organization lacks governance processes and AI maturity.

D. Purchase prebuilt Dynamics 365 agents and deploy them across all departments simultaneously

Large-scale deployment across all departments without governance and phased adoption increases implementation risk and reduces the likelihood of successful adoption.

Q89. A financial services firm wants an AI-powered solution to analyse customer interactions and provide next-best-action recommendations to relationship managers. The firm already uses Dynamics 365 Sales. The solution must integrate with their proprietary risk scoring system hosted in Azure.

Which approach best balances time-to-value with the firm's specific requirements?

- A. Build a custom AI solution from scratch in Microsoft Foundry using proprietary models
- B. Extend Microsoft 365 Copilot with custom connectors to the risk scoring system
- C. Extend the existing Copilot for Sales in Dynamics 365 with custom connectors to the risk scoring system and configure business terms for the firm's domain
- D. Buy a third-party AI sales analytics platform and integrate it with Dynamics 365

Answer:

C. Extend the existing Copilot for Sales in Dynamics 365 with custom connectors to the risk scoring system and configure business terms for the firm's domain

Explanation:

Correct Answers:

C. Extend the existing Copilot for Sales in Dynamics 365 with custom connectors to the risk scoring system and configure business terms for the firm's domain

The company already uses Dynamics 365 Sales, so extending Copilot for Sales provides the fastest time-to-value while leveraging existing investments. Custom connectors allow integration with the proprietary Azure-hosted risk scoring system, and configuring business terms enables the AI solution to align with the firm's financial services domain and terminology.

Incorrect Answers:

A. Build a custom AI solution from scratch in Microsoft Foundry using proprietary models

Building a completely custom solution increases development time, complexity, and cost, reducing time-to-value.

B. Extend Microsoft 365 Copilot with custom connectors to the risk scoring system

Microsoft 365 Copilot is more focused on productivity scenarios and is less specialized for Dynamics 365 Sales workflows and CRM-driven recommendations.

D. Buy a third-party AI sales analytics platform and integrate it with Dynamics 365

A third-party platform introduces additional integration complexity and may not align as effectively with existing Dynamics 365 capabilities.

Q90. You are designing a customer service agent in Copilot Studio for an insurance company. The agent needs to handle policy enquiries, claims submissions, and general questions. When the agent cannot understand a customer's request, it should collect the customer's details and create a support ticket.

How should you design the topic architecture?

- A. Create a single topic that handles all three functions through branching logic
- B. Create separate topics for policy enquiries, claims submissions, and general questions, with a fallback topic that collects customer details and creates a support ticket
- C. Create separate topics without a fallback, relying on the agent to redirect users to the company website
- D. Create a single generative AI topic and allow the model to determine the correct response for all scenarios

Answer:

B. Create separate topics for policy enquiries, claims submissions, and general questions, with a fallback topic that collects customer details and creates a support ticket

Explanation:

Correct Answers:

B. Create separate topics for policy enquiries, claims submissions, and general questions, with a fallback topic that collects customer details and creates a support ticket

Using separate topics provides better organization, maintainability, and accuracy for different business scenarios. A fallback topic ensures that when the agent cannot understand the request, customer details are collected and a support ticket is created, improving customer experience and operational continuity.

Incorrect Answers:

A. Create a single topic that handles all three functions through branching logic

A single large topic becomes difficult to maintain, scale, and troubleshoot as complexity increases.

C. Create separate topics without a fallback, relying on the agent to redirect users to the company website

Without a fallback topic, unresolved customer requests may lead to poor user experience and missed support cases.

D. Create a single generative AI topic and allow the model to determine the correct response for all scenarios

Relying entirely on generative AI reduces control and predictability for structured insurance workflows like claims and policy handling.

AB-100

CASE STUDY QUESTIONS

FABRIKAM

CASE STUDY

CONTOSO

CASE STUDY

Fabrikam Case Study

Background:

Fabrikam Inc. is a global consumer goods company that is undergoing a digital transformation initiative to migrate its entire infrastructure to the Microsoft cloud. As a key element of this cloud migration, the company will implement Microsoft Dynamics 365 Sales, moving away from the current on-premises proprietary technologies used by its business-to-business (B2B) sales team.

As part of the cloud migration, Fabrikam will adopt an AI-first approach to its business solutions and implement AI solutions, wherever possible, to streamline operations.

Problem Statements:

Fabrikam's infrastructure currently relies on various on-premises systems that require sales executives to use corporate computers with physical keyboards to access business information during customer interactions. Mobile phones cannot be used for these purposes, as the systems depend on keyboard input. As a result, the sales executives spend a lot of time using keyboards to search for data on several disparate systems and file servers, rather than focusing on the customers. This affects the customer experience. Fabrikam stakeholders are concerned that users will be hesitant to adopt AI. If the AI initiatives are NOT adopted, cost savings will never be realized. Additionally, funding for future AI initiatives will depend on demonstrating an increase in AI adoption month over month. As the AI agent initiative for the sales team will be the first for Fabrikam, the rapid adoption of the agent is a high priority.

Planned Initiatives:

General:

Fabrikam management has prioritized AI-driven projects to improve efficiency, customer engagement, and responsible AI adoption. The current application infrastructure is on-premises and must be migrated to the cloud to support the adoption of these technologies.

Infrastructure Migration:

Fabrikam plans to migrate from its current on-premises infrastructure to a completely cloud-based topology; this will include user authentication, the security framework, and, primarily, the adoption of the services by end users. All the data from the different systems will be consolidated into a single data source - a common data model that will use a Microsoft Dataverse environment as a single source of truth (SSOT) for the sales team.

Sales Cycle Enablement:

To achieve the company's objectives, Fabrikam intends to implement the following strategies to enhance the sales cycle:

- Use low-code development to create a single AI agent that has Dataverse as its core component.
- Ensure that sales managers can access unanswered correspondence from prospects and intervene as appropriate.
- Replace the previous proprietary software with Dynamics 365 Sales to track sales cycles and customer interactions.

- Have the sales executives use Dynamics 365 Sales to track interactions for open opportunities and send follow-up communications to prospects.
- Have the sales executives use handsfree headsets to interact with an AI agent when they have questions about internal policies or customer data.

Requirements:

Infrastructure Migration:

Fabrikam has identified the following infrastructure migration requirements:

- Azure must be used for all future infrastructure workloads.
- The company must follow Microsoft-recommended methodologies for infrastructure migration to the cloud.
- Any created AI agents must have their return on investment (ROI) calculated to ensure that the solution will save the company money.

Sales Cycle Enablement -

Fabrikam has identified the following requirements for sales cycle enablement:

- The final AI agent must follow Microsoft recommendations for a conversational user experience.
- A designated checklist must be reviewed to ensure that the AI agent follows Microsoft deployment recommendations for a compliant solution.
- Detailed telemetry must be logged for the first created AI agent to help troubleshoot and optimize the agent during the initial AI agent adoption process.
- Unexpected AI agent actions must end in an escalation to a live representative. For example, a sales executive must be rerouted to a representative if the agent cannot answer a question after two failed attempts.
- The return on investment (ROI) of switching from the current process to the future process is required for stakeholder sign off.
- The sales team must use Dynamics 365 Sales to correspond with prospects more quickly and efficiently than currently.
- Sales managers must report on the adoption of the AI agent to key Fabrikam stakeholders on a monthly basis.
- Any sensitive information, such as user IDs and names, shared via the AI agent must be tracked for future auditing.

Q91. Which tool should you recommend to address the sensitive information concerns in the sales process?

- A. the Analytics tab in Microsoft Copilot Studio
- B. Model Context Protocol (MCP)
- C. Application Insights
- D. Microsoft Foundry Tracing UI
- E. Monitoring in Microsoft Foundry

Answer:

D. Microsoft Foundry Tracing UI**Explanation:****Correct Answers:****D. Microsoft Foundry Tracing UI**

The case study states that sensitive information such as user IDs and names shared through the AI agent must be tracked for future auditing. Microsoft Foundry Tracing UI provides detailed traceability and monitoring of AI agent interactions, making it suitable for auditing sensitive information and investigating AI behavior.

Incorrect Answers:**A. the Analytics tab in Microsoft Copilot Studio**

The Analytics tab focuses on usage and performance metrics, not detailed auditing of sensitive information.

B. Model Context Protocol (MCP)

MCP standardizes communication between models and tools but does not provide auditing or sensitive data tracking capabilities.

C. Application Insights

Application Insights captures telemetry and diagnostics but is not specifically designed for tracing sensitive AI interaction data for auditing.

E. Monitoring in Microsoft Foundry

Monitoring provides operational oversight and health metrics, but the Tracing UI is more appropriate for detailed auditing and trace-level visibility.

Q92. Which components should you use to meet the sales cycle enablement requirements?

For AI agent creation:

▼
Microsoft Foundry
Dynamics 365 Sales
Microsoft Copilot Studio
the Power Platform admin center

For unexpected AI agent actions:

▼
a custom connector
an event trigger
a Fallback topic
a REST API

Answer:

For AI agent creation:

Microsoft Foundry
Dynamics 365 Sales
Microsoft Copilot Studio
the Power Platform admin center

For unexpected AI agent actions:

a custom connector
an event trigger
a Fallback topic
a REST API

Explanation:

Correct Answers:

Microsoft Copilot Studio

The case study specifies that Fabrikam wants to use low-code development to create a single AI agent with Dataverse as the core component. Microsoft Copilot Studio is the recommended low-code platform for building conversational AI agents integrated with Dataverse and Dynamics 365.

a Fallback topic

Fabrikam requires that unexpected AI agent actions must escalate to a live representative after failed attempts. A Fallback topic is specifically designed to handle unrecognized or failed conversations and reroute users appropriately.

Incorrect Answers:

Microsoft Foundry

Microsoft Foundry is more suited for advanced AI development scenarios rather than low-code conversational agent creation.

Dynamics 365 Sales

Dynamics 365 Sales manages sales workflows and customer interactions but is not the primary AI agent creation platform.

the Power Platform admin center

The Power Platform admin center is used for administration and governance, not agent development.

a custom connector

Custom connectors integrate external systems but do not handle unexpected conversational flows.

an event trigger

Event triggers initiate workflows but are not designed for escalation handling after failed AI interactions.

a REST API

REST APIs enable communication between services but do not provide conversational fallback capabilities.

Q93. Which framework should you use for the infrastructure migration?

- A. Microsoft Cloud Adoption Framework for Azure
- B. Success by Design
- C. Microsoft Power Platform Center of Excellence (CoE)
- D. Microsoft Power Platform Project Setup Wizard

Answer:

A. Microsoft Cloud Adoption Framework for Azure

Explanation:

Correct Answers:

A. Microsoft Cloud Adoption Framework for Azure

The case study explicitly states that Fabrikam must follow Microsoft-recommended methodologies for infrastructure migration to the cloud. The Microsoft Cloud Adoption Framework for Azure provides proven guidance, best practices, governance, strategy, and migration methodologies for moving enterprise infrastructure to Azure.

Incorrect Answers:

B. Success by Design

Success by Design focuses on Dynamics 365 implementation guidance, not enterprise infrastructure migration to Azure.

C. Microsoft Power Platform Center of Excellence (CoE)

The CoE provides governance and best practices for Power Platform adoption, not cloud infrastructure migration.

D. Microsoft Power Platform Project Setup Wizard

The Project Setup Wizard helps configure Power Platform projects but is not a migration framework for Azure infrastructure.

Q94. Which existing tool and data should you use to gather the required metrics for stakeholder signoff for the AI agents?

Tool:

Microsoft Foundry
Azure Resource Monitor (ARM)
Dynamics 365 Sales
Microsoft Copilot Studio

Data required for the tool:

the cumulative time spent on the task over the past year
the current cost to complete the tasks per instance
the current time to complete the task today per instance
the current cost of the Dynamics 365 Sales licenses

Answer:

Tool:

Microsoft Foundry
Azure Resource Monitor (ARM)
Dynamics 365 Sales
Microsoft Copilot Studio

Data required for the tool:

the cumulative time spent on the task over the past year
the current cost to complete the tasks per instance
the current time to complete the task today per instance
the current cost of the Dynamics 365 Sales licenses

Explanation:

Correct Answers:

Microsoft Copilot Studio

The Fabrikam case study states that stakeholder signoff requires calculating the return on investment (ROI) of moving from the current manual process to the future AI-assisted process. Microsoft Copilot Studio includes capabilities that help organizations measure productivity improvements, automation impact, and operational efficiency gains delivered by AI agents. Since Fabrikam plans to build a low-code AI agent using Microsoft technologies, Copilot Studio is the most appropriate existing tool to help gather and evaluate these metrics.

the current time to complete the task today per instance

To accurately calculate ROI, Fabrikam needs a measurable baseline from the current process. The current time required to complete each task instance provides a direct operational metric that can later be compared with the AI-assisted workflow. This allows stakeholders to quantify productivity gains, efficiency improvements, and time savings achieved through the AI agent implementation.

Incorrect Answers:**Microsoft Foundry**

Microsoft Foundry is primarily focused on AI application development and orchestration, not ROI estimation for business process automation.

Azure Resource Monitor (ARM)

ARM is used for Azure resource deployment and management and does not provide business productivity metrics.

Dynamics 365 Sales

Dynamics 365 Sales manages customer and sales data but is not the primary tool for measuring AI solution ROI.

the cumulative time spent on the task over the past year

This provides historical data, but it is less effective for measuring real-time process efficiency improvements per transaction.

the current cost to complete the tasks per instance

Cost data is useful, but operational time savings are the most direct and commonly used productivity metric for AI ROI calculations.

the current cost of the Dynamics 365 Sales licenses

License costs alone do not demonstrate efficiency improvements or business value from AI adoption.

Q95. Which framework should you use for the infrastructure migration?

- A. IT Helpdesk in Microsoft Copilot Studio
- B. AI agents in Microsoft Foundry
- C. Voice in Microsoft Copilot Studio
- D. AI chat in Microsoft Foundry

Answer:**C. Voice in Microsoft Copilot Studio****Explanation:****Correct Answers:****C. Voice in Microsoft Copilot Studio**

The Fabrikam case study states that sales executives must use handsfree headsets to interact with an AI agent when asking questions about internal policies or customer data. Voice capabilities in Microsoft Copilot Studio are specifically designed for conversational voice interactions, enabling users to communicate with AI

agents handsfree. This directly supports the company's requirement to reduce dependency on keyboards and improve the customer interaction experience.

Incorrect Answers:

A. IT Helpdesk in Microsoft Copilot Studio

The IT Helpdesk template is designed for IT support scenarios and does not specifically address voice-enabled sales interactions.

B. AI agents in Microsoft Foundry

Microsoft Foundry supports advanced AI agent development but is not the primary low-code voice interaction solution for sales executives.

D. AI chat in Microsoft Foundry

AI chat focuses on text-based conversational experiences rather than handsfree voice-enabled interactions.

Q96. Which framework should you use to meet the AI agent requirements for the sales cycle enablement?

For Microsoft Copilot Studio best practices:

the ALM Accelerator for Microsoft Power Platform
Microsoft Cloud Adoption Framework for Azure
Microsoft Power Platform Well-Architected framework
Success by Design

For conversational user experiences:

the ALM Accelerator for Microsoft Power Platform
Microsoft Cloud Adoption Framework for Azure
Microsoft Power Platform Well-Architected framework
Success by Design

Answer:

For Microsoft Copilot Studio best practices:

the ALM Accelerator for Microsoft Power Platform
 Microsoft Cloud Adoption Framework for Azure
Microsoft Power Platform Well-Architected framework
 Success by Design

For conversational user experiences:

the ALM Accelerator for Microsoft Power Platform
 Microsoft Cloud Adoption Framework for Azure
 Microsoft Power Platform Well-Architected framework
Success by Design

Explanation:

Correct Answers:

Microsoft Power Platform Well-Architected framework

The Fabrikam case study requires that a designated checklist be reviewed to ensure the AI agent follows Microsoft deployment recommendations for a compliant solution. The Microsoft Power Platform Well-Architected framework provides best practices, design guidance, operational excellence principles, security recommendations, and governance guidance for Power Platform and Copilot Studio solutions.

Success by Design

The case study also requires that the AI agent follow Microsoft recommendations for conversational user experiences. Success by Design provides guidance and design principles for creating effective, user-friendly, and scalable conversational experiences within Dynamics 365 and Power Platform solutions.

Incorrect Answers:

the ALM Accelerator for Microsoft Power Platform

The ALM Accelerator supports deployment automation and lifecycle management but does not primarily define conversational UX or architectural best practices.

Microsoft Cloud Adoption Framework for Azure

This framework focuses on cloud adoption and infrastructure migration rather than conversational AI experience design.

Q97. Which tool should you recommend to help secure funding for future AI agent development?

- A. Evaluations in Microsoft Foundry
- B. the Azure Cost Optimization workbook
- C. Azure Operator Insights
- D. the Analytics tab in Microsoft Copilot Studio
- E. Direct Preference Optimization (DPO)

Answer:

D. the Analytics tab in Microsoft Copilot Studio

Explanation:

Correct Answers:

D. the Analytics tab in Microsoft Copilot Studio

The Fabrikam case study states that funding for future AI initiatives depends on demonstrating increased AI adoption month over month. The Analytics tab in Microsoft Copilot Studio provides detailed usage metrics, adoption trends, engagement statistics, conversation success rates, and user interaction insights. These analytics help sales managers report adoption metrics to stakeholders and justify continued investment in future AI agent development.

Incorrect Answers:

A. Evaluations in Microsoft Foundry

Evaluations focus on assessing model quality and performance rather than measuring organizational adoption trends.

B. the Azure Cost Optimization workbook

This workbook helps optimize Azure spending but does not measure AI agent adoption or business engagement.

C. Azure Operator Insights

Azure Operator Insights is designed for telecom and operational analytics scenarios, not AI adoption reporting.

E. Direct Preference Optimization (DPO)

DPO is a model tuning technique used to improve AI responses and is unrelated to adoption measurement or funding justification.

Q98. Which tool should you use for the prospect communication requirements in Dynamics 365 Sales?

- A. Azure AI Search
- B. Copilot email assist
- C. the Voice template Microsoft Copilot Studio
- D. Deep Research in Microsoft Foundry Agent Service

Answer:

B. Copilot email assist

Explanation:

Correct Answers:

B. Copilot email assist

The Fabrikam case study states that sales executives must use Dynamics 365 Sales to correspond with prospects more quickly and efficiently. Copilot email assist in Dynamics 365 Sales helps users draft,

summarize, and generate contextual follow-up emails rapidly using AI. This directly improves communication speed, productivity, and customer engagement throughout the sales cycle.

Incorrect Answers:

A. Azure AI Search

Azure AI Search is used for indexing and searching enterprise data, not for generating prospect communications.

C. the Voice template Microsoft Copilot Studio

The Voice template supports voice-based conversational experiences but does not specifically optimize email communication with prospects.

D. Deep Research in Microsoft Foundry Agent Service

Deep Research is intended for advanced AI research and analysis tasks rather than sales communication assistance.

Contoso Case Study Overview:

Contoso Ltd. is a high-tech manufacturing company that uses Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, and Dynamics 365 Commerce for its North American operations. The company designs and develops innovative products that have many patents and proprietary technologies. The patents and engineering designs are closely guarded secrets.

Contoso executives want to integrate and adopt AI solutions to help scale the company in preparation for an anticipated period of rapid growth.

The company has multiple legal entities and Azure subscriptions that will be used in the adopted AI solutions.

Requirements:

AI Adoption:

The following executives will have specific responsibilities in the overall AI adoption:

- Chief Technology Officer (CTO): Select one Dynamics 365 Finance, Dynamics 365 Supply Chain Management or Dynamics 365 Commerce prebuilt AI agent and one custom Microsoft Copilot Studio AI agent to prioritize and deploy during the initial AI adoption phase.
- Chief Information Officer (CIO): Ensure that appropriate security labels are assigned to the data used by the AI agents.

- Chief Financial Officer (CFO): Analyze the return on investment (ROI) for the AI agents being deployed.
- Chief Information Security Officer (CISO): Discover and inventory AI resources for auditing.
- Chief Executive Officer (CEO): Ensure that all solutions adhere to industry-standard responsible AI practices.

All AI initiatives and agents will have a detailed business use case, a defined audience profile, and an estimated ROI that will compare the cost savings of the current process against the estimated costs of using the new AI solutions.

The company's research and development (R&D) department already has a custom Model Context Protocol (MCP) server that contains comprehensive product specifications and compliance data.

Prebuilt AI Agent:

The CTO has NOT yet selected which prebuilt AI agent to use in Dynamics 365 Supply Chain Management. The CTO wants to view available agent templates to identify which agent will add the most business value.

Depending on which high-priority AI agents are identified, its agent capabilities must be previewed in a discovery meeting with the relevant business operation stakeholders.

Custom AI Agent:

Contoso has identified the following custom AI agent requirements:

- The custom AI agent will use data from Dynamics 365 Supply Chain Management to answer questions for the manufacturing team as a low-code solution.
- The custom AI agent will be accessible from within Microsoft Teams.
- The custom AI agent must be designed to eventually connect to other agents that can be selected based on their description.
- The topics used in the custom AI agent will be selected based NOT on a trigger phrase, but on a description of the purpose of the query, to make the interactions more conversational.
- The custom AI agent must be able to answer questions about product specifications by using existing technologies. The product specifications are maintained by the R&D department.
- The custom AI agent must be integrated with and accessible from Dynamics 365 Supply Chain Management.
- The custom AI agent must be able to use Dynamics 365 Supply Chain Management business logic that is stored outside of the application.

Analysis, Reporting, and Troubleshooting:

Contoso has identified the following analysis, reporting, and troubleshooting requirements:

- The CISO will audit all the AI solutions monthly for compliance and security.

- The CFO will analyze all the AI solutions quarterly to compare the estimated ROI against actual measured efficiencies and adoption. The CFO will use the Copilot Studio agent usage estimator to perform this analysis.
- The CISO wants to identify how much sensitive data was accessed for a given AI agent run and who accessed the data. Too much sensitive data accessed by a single user might indicate a high security risk.
- The CTO wants to track user feedback on the quality of the AI agent responses during user interactions with the agents. Consistently poor feedback will trigger an escalated reengineering discussion.
- The CEO wants a quarterly assessment of all the required metrics for their specific responsibilities. The tools used for the assessments must be Microsoft-recommended and must verify reliability, interpretability, fairness, and compliance.
- The CFO wants to identify how many interactions with the AI agents are abandoned on a given day as compared to resolved conversations. Too many abandoned sessions might indicate that Copilot Studio credits are being used inefficiently by end users.

Q99. Which two components in the custom AI agent design should the CFO evaluate in the quarterly agent analysis?

- A. the GPT models used for the agent
- B. the average characters in a chat message
- C. the agent orchestration method
- D. the average session time per agent

Answer:

- A. the GPT models used for the agent**
- C. the agent orchestration method**

Explanation:

Correct Answers:

A. the GPT models used for the agent

The GPT models selected for the AI agent directly affect operational cost, response quality, latency, and overall efficiency. Since the CFO is responsible for quarterly ROI analysis and comparing estimated savings against actual efficiencies, evaluating the models used is important to understand whether the AI solution is cost-effective and appropriately optimized for business value.

C. the agent orchestration method

The orchestration method determines how the AI agent coordinates workflows, invokes tools, routes tasks, and manages interactions between systems or subagents. Different orchestration approaches can impact compute consumption, scalability, performance, and operational efficiency. These factors directly influence ROI and are therefore important for CFO-level quarterly analysis.

Incorrect Answers:

B. the average characters in a chat message

Average message length is a low-level conversational metric and does not provide meaningful financial or operational insight for ROI evaluation.

D. the average session time per agent

Session duration may indicate engagement trends, but by itself it does not directly evaluate architectural efficiency, operational cost, or AI optimization effectiveness.

Q100. What should you include in the custom AI agent design to meet the R&D product specifications and the compliance information requirements?

To expose the data to the agent, create:

an Azure AI Bot Service channel
a custom connector
a custom OData entity
the Semantic Kernel

Add to the agent:

an event trigger
the MCP server
a REST API
a tool

Answer:

To expose the data to the agent, create:

an Azure AI Bot Service channel
a custom connector
a custom OData entity
the Semantic Kernel

Add to the agent:

an event trigger
the MCP server
a REST API
a tool

Explanation:

Correct Answers:

To expose the data to the agent, create: a custom connector

A custom connector enables the AI agent to securely connect to enterprise systems, APIs, and external business applications that contain the R&D product specifications and compliance information. It provides a reusable and standardized integration mechanism that allows the agent to retrieve trusted organizational data during interactions.

Add to the agent: a tool

A tool allows the AI agent to interact with connected systems and use the exposed data during conversations and workflows. By adding a tool, the agent can dynamically retrieve product specifications, access compliance information, and perform business operations required by users in real time.

Incorrect Answers:**an Azure AI Bot Service channel**

Bot Service channels are used for communication endpoints and user interaction channels, not for exposing enterprise data.

a custom OData entity

OData entities structure data access but are not the primary recommended mechanism for integrating enterprise systems with AI agents.

the Semantic Kernel

Semantic Kernel is used for AI orchestration and workflow composition rather than exposing enterprise business data.

an event trigger

Event triggers automate workflow execution but do not directly provide data access to the AI agent.

the MCP server

The MCP server standardizes communication between models and tools but is not itself a data exposure mechanism.

a REST API

REST APIs expose services, but the recommended approach is to connect them to the agent through connectors and tools.

Q101. Which two components for the custom AI agent should you include in the application lifecycle management (ALM) process?

- A. an Azure package
- B. a ZIP package
- C. a Microsoft Power Platform solution
- D. a Cloud Scale Unit (CSU) package
- E. an X++ model

Answer:

B. a ZIP package

C. a Microsoft Power Platform solution

Explanation:

Correct Answers:**B. a ZIP package**

In Microsoft Copilot Studio and Power Platform ALM processes, solutions are commonly exported and moved between environments as ZIP packages. This enables version control, deployment automation, backup, and consistent release management across development, testing, and production environments.

C. a Microsoft Power Platform solution

Microsoft Power Platform solutions are the primary ALM container for Copilot Studio components, flows, connectors, and related assets. Solutions help package, transport, manage, and deploy AI agent components in a structured and governed way throughout the lifecycle process.

Incorrect Answers:**A. an Azure package**

Azure packages are not the standard ALM packaging mechanism for Copilot Studio and Power Platform solutions.

D. a Cloud Scale Unit (CSU) package

CSU packages are related to Dynamics 365 Commerce scale units and are not relevant to AI agent ALM.

E. an X++ model

X++ models are used in Dynamics 365 Finance and Operations development, not in Copilot Studio AI agent lifecycle management.

Q102. Which tools should you recommend to assist the CISO and the CIO with their specific responsibilities? To answer, drag the appropriate tools to the correct executives. Each tool may be used once, more than once, or not at all.

Tools
 Azure Blob Storage

 Azure Resource Graph Explorer

 Copilot Studio

 Microsoft Purview
CISO: CIO: **Answer:**

ToolsCISO: CIO: **Explanation:****Correct Answers:****Microsoft Purview for the CISO**

The Contoso case study states that the CISO must discover and inventory AI resources for auditing and identify how much sensitive data was accessed during AI agent interactions and who accessed it. Microsoft Purview provides AI governance, compliance management, auditing, sensitivity labeling awareness, and data access tracking capabilities. It enables the CISO to monitor AI-related data usage, audit user interactions, and identify potential security risks involving sensitive information.

Microsoft Purview for the CIO

The CIO is responsible for ensuring that appropriate security labels are assigned to the data used by the AI agents. Microsoft Purview provides data classification, sensitivity labeling, information protection, and governance capabilities that allow the organization to apply and manage security labels across enterprise data sources. This ensures that AI agents interact with data according to organizational compliance and security requirements.

Incorrect Answers:**Azure Blob Storage**

Blob Storage is a storage service and does not provide AI governance, security labeling, or auditing capabilities.

Azure Resource Graph Explorer

Resource Graph Explorer inventories Azure infrastructure resources but does not provide sensitive data auditing, AI interaction monitoring, or security label management.

Copilot Studio

Copilot Studio is used to build and manage AI agents, but enterprise-wide data governance and compliance responsibilities are handled by Microsoft Purview.

Q103. What should you configure for the custom AI agent?

- A. AI-assisted evaluators
- B. classic orchestration
- C. generative orchestration
- D. Azure OpenAI reasoning models

Answer:**C. generative orchestration****Explanation:****Correct Answers:****C. generative orchestration**

The Contoso case study states that the custom AI agent topics must be selected based on the description and purpose of the query rather than trigger phrases, making the interactions more conversational. Generative orchestration enables AI-driven intent understanding and dynamic routing of conversations based on semantic meaning instead of predefined keywords or trigger phrases. This directly supports conversational and natural language interactions.

The case study also mentions that the agent must eventually connect to other agents selected based on their description. Generative orchestration is designed to support intelligent agent selection and dynamic orchestration between multiple agents.

Incorrect Answers:**A. AI-assisted evaluators**

AI-assisted evaluators are used for assessment and quality evaluation rather than conversational routing or orchestration.

B. classic orchestration

Classic orchestration relies primarily on predefined trigger phrases and deterministic routing, which does not meet the conversational requirements.

D. Azure OpenAI reasoning models

Reasoning models improve complex reasoning capabilities but do not specifically provide conversational topic orchestration and dynamic agent routing.

Q104. Which Copilot Studio analytics metrics should you recommend to assist the executives with their specific responsibilities? To answer, drag the appropriate metrics to the correct executives. Each metric may be used once, more than once, or not at all.

MetricsCFO concerns about Copilot Studio credit usage: CTO concerns about poor feedback on AI agent responses: **Answer:**

MetricsCFO concerns about Copilot Studio credit usage: CTO concerns about poor feedback on AI agent responses: **Explanation:****Correct Answers:****Effectiveness**

The Contoso case study states that the CFO wants to compare abandoned AI interactions against resolved conversations to determine whether Copilot Studio credits are being used efficiently. In Copilot Studio analytics, metrics such as resolution rate, abandonment rate, and escalation trends are part of the Effectiveness category. These metrics directly help measure whether AI conversations successfully resolve user needs or consume credits inefficiently through abandoned sessions.

Satisfaction

The CTO wants to track user feedback on the quality of AI agent responses and identify consistently poor experiences that may require reengineering. The Satisfaction metric measures customer sentiment, ratings, CSAT feedback, and user experience quality during AI interactions. This makes it the most appropriate metric for monitoring response quality and identifying problematic conversations.

Incorrect Answers:**Use**

Use metrics track interaction volume, active sessions, and engagement trends, but they do not specifically measure abandoned versus resolved conversations.

Tool use

Tool use metrics focus on how frequently tools, plugins, connectors, or external integrations are invoked by the AI agent rather than user satisfaction or conversation effectiveness.

Q105. What should you recommend to assist the CTO with the prebuilt agent selection process?

- A. Agent management
- B. Copilot Studio
- C. Lifecycle Services (LCS)
- D. Immersive Home

Answer:

A. Agent management

Explanation:**Correct Answers:****A. Agent management**

The Contoso case study states that the CTO has not yet selected a prebuilt AI agent for Dynamics 365 Supply Chain Management and wants to view available agent templates and preview their capabilities during discovery meetings with stakeholders. Agent management is the administrative workspace within Dynamics 365 Finance and Operations applications that allows administrators and technical leaders to discover, configure, evaluate, and manage first-party AI agents and templates before deployment.

It provides visibility into available agent capabilities and supports the onboarding and configuration process for Dynamics 365 AI agents, making it the most appropriate tool for the CTO's selection and evaluation requirements.

Incorrect Answers:**B. Copilot Studio**

Copilot Studio is used primarily for creating and customizing low-code AI agents rather than browsing and evaluating prebuilt Dynamics 365 ERP AI agent templates.

C. Lifecycle Services (LCS)

Lifecycle Services supports Dynamics 365 environment deployment, updates, and lifecycle operations, but it does not provide prebuilt AI agent discovery and preview functionality.

D. Immersive Home

Immersive Home is designed for operational experiences and process visibility rather than administrative management and evaluation of prebuilt AI agent templates.

Q106. What should you recommend to assist the CEO with their specific responsibilities?

- A. the Microsoft Service Trust Portal
- B. Microsoft Foundry Tools
- C. Microsoft Purview
- D. the Responsible AI dashboard
- E. Compliance Center

Answer:**D. the Responsible AI dashboard****Explanation:****Correct Answers:****D. the Responsible AI dashboard**

The Contoso case study states that the CEO wants quarterly assessments that verify reliability, interpretability, fairness, and compliance using Microsoft-recommended tools. These are core Responsible AI

principles. The Responsible AI dashboard is specifically designed to evaluate and monitor AI systems against responsible AI metrics such as fairness, explainability, reliability, transparency, and model behavior analysis. This directly supports the CEO's requirement to ensure that all AI solutions adhere to industry-standard responsible AI practices.

Incorrect Answers:

A. the Microsoft Service Trust Portal

The Service Trust Portal provides compliance documentation and audit reports but does not evaluate AI models for fairness, interpretability, or reliability.

B. Microsoft Foundry Tools

Microsoft Foundry Tools support AI development and orchestration but are not specifically designed as a Responsible AI assessment dashboard.

C. Microsoft Purview

Microsoft Purview focuses on governance, compliance, auditing, and data protection rather than Responsible AI metric evaluation.

E. Compliance Center

Compliance Center manages compliance policies and regulatory controls but does not provide Responsible AI assessment capabilities.
